

MODIFIED DRAFT INTERIM DEVELOPMENT PLAN

FOR PART OF NAVI MUMBAI AIRPORT INFLUENCE NOTIFIED AREA (NAINA) (23 Villages in Panvel Taluka)

CITY AND INDUSTRIAL DEVELOPMENT CORPORATION OF MAHARASHTRA LTD

SPECIAL PLANNING AUTHORITY FOR NAVI MUMBAI AIRPORT INFLUENCE NOTIFIED AREA

(Appointed by Government of Maharashtra under Section (40)(1)(b) of MR&TP Act 1966 on 10th January 2013)

AugustSeptember, 20142015

TABLE OF CONTENTS

| <u>1. </u> | INTRODUCTION | <u>1</u> |
|---|---|------------|
| 1.1 | BACKGROUND | 1 |
| 1.2 | NAVI MUMBAI AIRPORT INFLUENCE NOTIFIED AREA (NAINA) | 1 |
| 1.3 | NEED FOR INTERIM DEVELOPMENT PLAN (IDP) | |
| 1.4 | SELECTION OF IDP AREA | |
| | 1.4.1 CRITERIA FOR SELECTION | |
| | 1.4.1 CRITERIA FOR SELECTION | <u></u> |
| 1.5 | PROCEDURE AND CONTENT OF IDP AS PER MR&TP ACT, 1966 | Z |
| 1.5 | | |
| 2. | EXISTING PROFILE OF IDP AREA | 6 |
| 2.1 | INTRODUCTION | 6 |
| | 2.1.1 LOCATION, REGIONAL SETTING AND ENVIRONMENT Area | 6 |
| | 2.1.2 REGIONAL SETTING | |
| | 2.1.3 TOPOGRAPHY | 7 |
| | 2.1.4 SOIL CONDITIONS | |
| | 2.1.5 GEOMORPHOLOGY | 7 |
| | 2.1.6 CLIMATE | 7 |
| 2.2 | | 8 |
| | 2.2.1 POPULATION GROWTH | |
| | 2.2.2 POPULATION STRUCTURE AND DISTRIBUTION | |
| | | |
| | 2.2.2.1 POPULATION DENSITY | 9 |
| | 2.2.2.3 LITERACY RATE | |
| | 2.2.3 ECONOMIC BASE | 10 |
| | 2.2.3.1 MAJOR ECONOMIC ACTIVITES | 10 |
| | 2.2.3.2 OCUPATIONAL STRUCTURE and WFPR | |
| | 2.2.3.3 EMPLOYMENT PATTERN | |
| 2.3 | EXISTING TRANSPORTATION NETWORK | 11 |
| | 2.3.1 REGIONAL ROAD NETWORK | 11 |
| | 2.3.2 REGIONAL SUB-URBAN RAIL NETWORK | 14 |
| | 2.3.3 LOCAL ROAD NETWORK | 17 |
| | 2.3.4 BUS SYSTEM SERVICES | 17 |
| | 2.3.5 LOCAL SUB-URBAN RAILWAY NETWORK | 18 |
| | 2.3.6 PARKING FACILITIES | |
| | 2.3.7 SUMMARY | 18 |
| 2.4 | EXISTING LAND USE | 23 |
| | 2.4.1 DATA COLLECTION | 23 |
| | 2.4.2 BENCH MARK SURVEY | 23 |
| | 2.4.3 GCP COLLECTION | 24 |
| | 2.4.3.1 BASE STATION | |
| | 2.4.3.2 ROVER | |
| | 2.4.3.3 GCP DATA PROCESSING | |
| | 2.4.4 IMAGE PROCESSING | |
| | 2.4.5 DIGITIZATION AND DATA PROCESSING | |
| | 2.4.6 METHOD OF FIELD SURVEYS | |
| | 2.4.7 LiDAR SURVEY AND DATA PROCESSING | <u> 26</u> |
| | 2.4.7.1 LIDAR DATA PROCESSING | <u> 26</u> |
| | 2.4.8 QA AND QC PROCESS ADOPTED | |
| | 2.4.9 DISTRIBUTION OF LAND USE | |
| | 2.4.10 LAND AVAILABLE FOR DEVELOPMENT | |
| 0 - | 2.4.11 CONCLUSION | |
| 2.5 | SOCIAL INFRASTRUCTURE. | |
| | 2.5.1 EDUCATIONAL fACILITIES | |
| | 2.5.2 HEALTH FACILITIES | |
| | 2.5.3 COMMERCIAL FACILITIES | |
| | 2.5.4 SOCIO-CULTURAL FACILITIES | |
| | 2.5.5 RECREATIONAL FACILITIES | |
| | 2.5.6 SUMMARY | |
| 2.6 | PHYSICAL INFRASTRUCTURE | <u> 36</u> |

| | 2.6.1 WATER SUPPLY | <u> 36</u> |
|---|--|-------------------------------|
| | 2.6.2 SEWERAGE | 37 |
| | 2.6.3 STORM WATER DRAINAGE | 37 |
| | 2.6.4 SOLID WASTE MANAGEMENT. | |
| | 2.6.5 POWER SUPPLY | |
| | 2.6.5 POWER SUPPLY | 3 <i>1</i> |
| <u>3.</u> | ENVISIONING FUTURE | 39 |
| 3.1 | VISION FOR NAINA | |
| 3.2 | POPULATION FORECAST - NAINA | |
| 3.2 | | |
| | 3.2.1 METHODOLOGY | <u>39</u> |
| | 3.2.2 ESTIMATED POPULATION OF IDP AREA | <u> 45</u> |
| 4. | REQUIREMENT OF PUBLIC PURPOSES | 47 |
| 4.1 | PLANNING NORMS | |
| | | |
| 4.2 | ESTIMATED REQUIREMENT | |
| | 4.2.1 EDUCATIONAL FACILITIES | <u> 48</u> |
| | 4.2.2 HEALTH FACILITIES | <u> 48</u> |
| | 4.2.3 SOCIAL AND CULTURAL FACILITIES | |
| | 4.2.4 PUBLIC UTILITIES | 49 |
| | 4.2.5 PARKS AND PLAY GROUNDS | <u>50</u> |
| 4.3 | DISTRIBUTION OF SOCIAL INFRASTRUCTURE | 50 |
| _ | DDODOCED TRANSPORTATION NETWORK DI AN | |
| <u>5.</u> | PROPOSED TRANSPORTATION NETWORK PLAN | |
| <u>5.1</u> | PROPOSED TRANSPORTATION NETWORK | |
| | 5.1.1 CTS RECOMMENDED PROPOSALS IN NAINA | <u>53</u> |
| | 5.1.2 ADDITIONAL PROPOSED URBAN TRANSPORT NETWORK WITHIN IDP AREA | |
| | 5.1.3 PROPOSED RoWs FOR ROAD CORRIDORS | |
| | 5.1.4 METRO LINK EXTENSION TO IDP AREA | 60 |
| | PROPOSED LAWR MOS | |
| <u>6.</u> | PROPOSED LAND USE | |
| 6.1 | KEY CONSIDERATIONS OF THE PLAN | |
| | 6.1.1 PROPOSED ENTRY/EXIT POINTS TO THE IDP AREA | |
| | 6.1.2 PROTECTION OF NATURAL AREAS | |
| | 6.1.3 LEVERAGING EXISTING AND PROPOSED ECONOMIC NODES IN AND AROUND THE IDP AREA | 65 |
| | 6.1.4 TRANSIT ORIENTED DEVELOPMENT (TOD) | 65 |
| | 6.1.5 INTEGRATION OF GAOTHANS & EXPANSION AREAS | 66 |
| 6.2 | BROAD AND FLEXIBLE ZONING | <u>67</u> |

1. INTRODUCTION

1.1 BACKGROUND

CIDCO has been engaged in developing Navi Mumbai as a counter-magnet to Mumbai since 1970. The existing airport at Mumbai, is fast reaching saturation and scope for further enhancement of passenger and cargo handling facilities along with aircraft maintenance and city side facilities appeared very limited.

Therefore a second airport in the Mumbai Metropolitan Region (MMR) became crucial. The air travel demand forecasts indicated that demand will grow from 30 million passengers per annum in the year 2012-13 to over 100 million passengers per annum by 2030-31. The Mumbai airport alone will be unable to handle such an increase in demand. It was therefore imperative to build a second Airport for MMR. To meet the growing demands of air travel, following the policy of Greenfield airports in PPP mode, CIDCO initiated studies of locating the airport within Navi Mumbai and selected a location close to the mouth of Panyel Creek.

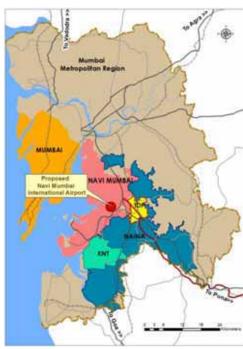

Figure 1-1: Location of NAINA in MMR

1.2 NAVI MUMBAI AIRPORT INFLUENCE NOTIFIED AREA (NAINA)

CIDCO successfully sought approvals for the proposed International Airport in Navi Mumbai from Government of Maharashtra, Ministry of Civil Aviation and Ministry of Environment & Forest, Government of India. While granting the Environmental and Coastal Regulations Zone (CRZ) clearances to the proposed Greenfield airport on 22nd November, 2010, Ministry of Environment & Forest (MoEF), Government of India, expressed concern about unplanned and haphazard development within 20 km of the Airport. In pursuance of these concerns, Government of Maharashtra notified the area around the proposed airport, identified as "Navi Mumbai Airport Influence Notified Area (NAINA)" and appointed CIDCO as the Special Planning Authority (SPA) for the same¹.

¹ CIDCO was appointed as SPA for NAINA, by GoM under Section 40(1) (b) of MR&TP Act, 1966 through Govt. Notification No. TPS-1712/475/CR-98/12/UD-12 dated 10th January, 2013. It covers 270 villages (256 from Raigad District and 14 from Thane District of Maharashtra). The total area of NAINA is about 561 km².

NAINA comprises 270 revenue villages from Uran, Panvel, Karjat, Khalapur, and Pen Talukas of Raigad district and Thane Taluka of Thane district of Maharashtra. Out of which, 217 are full revenue villages. Remaining 54 are part revenue villages. Together, it has an area of approximately 56,172 ha (561km²).

1.3 NEED FOR INTERIM DEVELOPMENT PLAN (IDP)

For SPA, it is mandatory to prepare Development Plan (DP) within 3 years from the date of appointment under Section 21 of MR&TP Act, 1966. Given the extensive area of NAINA and the content and procedure of preparing Development Plan as laid down in the MR&TP Act, 1966 the preparation of full-fledged Development Plan would require considerable time. It is therefore decided to prepare an Interim Development Plan (IDP) for a part of NAINA as enabled by MR&TP Act 1966.

Testing of Innovative Land Development Model: An innovative concept that promotes voluntary land assembly, contributes land for public purposes, finances infrastructure development, has been developed by CIDCO for NAINA. However, this concept needs to be tested quickly in the real world, with regard to its applicability and acceptability by the landowners and developers in NAINA.

Development Pressure: At present, development is guided by the MMR Regional Plan (RP), which permits limited development around Gaothans. However, area near Panvel due to its proximity to Panvel, emerging major railway station and the proximity to proposed airport is experiencing relatively accentuated activity. To manage such development pressures, provisions of MMR RP are not adequate and legal provisions by way of IDP and Development Control Regulations (DCR) are considered to be necessary. Based on the above considerations, it is proposed to prepare an (IDP) for part of NAINA as provided under section 32 of the MR&TP Act, 1966.

1.4 SELECTION OF IDP AREA

1.4.1 CRITERIA FOR SELECTION

The area covered in IDP is based on the following considerations:

- a) **Proximity to Navi Mumbai -** CIDCO has provided adequate infrastructure facilities in Navi Mumbai Area. The IDP area was selected in such a way that existing infrastructure network of Navi Mumbai can be extended to the proposed development. Hence, an area was selected in congruity to Navi Mumbai.
- b) Availability of Transport Network- The existing and proposed transport network is an important indicator for assessing the early potential for growth where new model of land development could be tested. The existing National Highways, State Highways, proposed Multi-Modal Corridor (MMC), proposed Mumbai-Vadodara spur, existing suburban rail network and proposed metro network etc, were considered to delineate the IDP area.
- c) Development Pressure CIDCO as SPA receives proposals for Development Permission in NAINA. In addition to this, cases of Non-Agriculture (NA) permission are directed by Collector to CIDCO seeking their remarks. Further, Special Township Projects (STPs) and Rental Housing Scheme locations are also known to CIDCO which are good indicators of urbanization pressure for development.

1.4.2 EXTENT OF COVERAGE IN IDP

d) Based on the criteria explained above, the area for IDP is selected. It comprises 23 villages with an area of 3683Ha. This comprises two part villages namely Nere and Vihighar. Remaining all are full revenue villages. The list of villages along with geographical area details are given in **Table 1-1** and **Figure 1-2** depicts the location of IDP Area in NAINA. The term "Project Area" in this document refers to whole of "NAINA".

Table 1-1: List of Villages covered within IDP Area

| Sl.No | Taluka | Village Name | GISArea (Ha) ² |
|-------|--------|--------------------------------------|---------------------------|
| 1 | Panvel | Adai | 308.4 |
| 2 | Panvel | Akurli | 167.2 |
| 3 | Panvel | Belavali | 159.3 |
| 4 | Panvel | Bonshet | 20.1 |
| 5 | Panvel | Borle | 100.4 |
| 6 | Panvel | Chikhale | 357.2 |
| 7 | Panvel | Chipale | 132.5 |
| 8 | Panvel | Derawali | 91.2 |
| 9 | Panvel | Devad | 114.6 |
| 10 | Panvel | Kolkhe | 228.6 |
| 11 | Panvel | Kon | 168.2 |
| 12 | Panvel | Koproli | 76.2 |
| 13 | Panvel | Moho | 306.9 |
| 14 | Panvel | Nere (Part Village) ³ | 291.6 |
| 15 | Panvel | Palaspe | 238.8 |

⁴ Part Vihighar village falling in MESZ, as indicated in NAINA Gazette Notification dated 10th January 2013

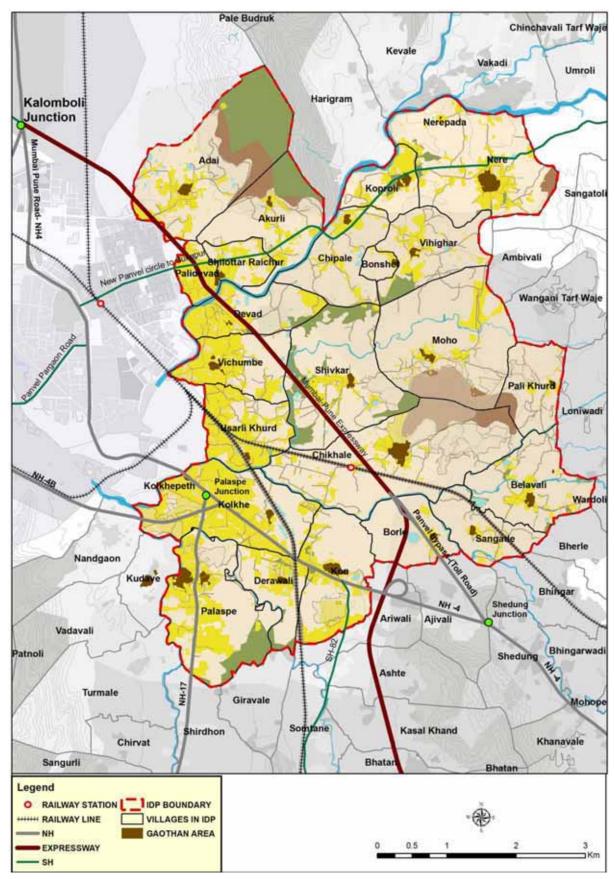

Figure 1-2: Villages covered in IDP Interim Development Plan Area

1.5 PROCEDURE AND CONTENT OF IDP AS PER MR&TP ACT, 1966

Preparation of IDP is enabled by the provisions under section 32 of the MR&TP Act, 1966. The timeline for IDP is given in Table 1-2.

Table 1-2: Procedure for preparation of IDP as per MR&TP Act, 1966

| MR&TP Act, 1966 Clause No. | Description | Date | | | |
|-------------------------------|---|--|--|--|--|
| 40 (1) (b) | Appointment of SPA for Notified Area | <u>-10-01-2013</u> | | | |
| 23 (1) | Date of Declaration of Intention for preparation of DP | - | | | |
| 32/25 | Carry out survey and Prepare Existing Land Use (ELU) | 15-07-14 | | | |
| 32/26(1) | Publish a Notice, Prepare & Publish Draft IDP | 14-08-14 | | | |
| 32/28(1) | | | | | |
| | Receiving of Suggestion/ Objection | Till 10-10-14 | | | |
| 32/28(2) | SPA to constitute Planning Committee (PC) | 10 13- <u>10</u> 1-1 <u>4</u> 5 | | | |
| | SPA to Forward Suggestion/ Objection to PC | 30 04 15 | | | |
| 32/28(3) | PC to give hearing & prepare Report and submit to SPA | 30 06 15 <u>11-9-15</u> | | | |
| | SPA to incorporate PC Report | <u>16-9-15</u> | | | |
| | SPA to incorporate PC Report | 13 07 15 | | | |
| 32/30(1) | Submission of Draft IDP along with list of modification to Government for approval <u>latest by</u> | 12 22-09-15 | | | |

In terms of the content of IDP, the requirements stated in clauses (a), (b) and (c) of section 22 of MR&TP Act, 1966 are mandatory. The same are described below:

- a) Proposals for allocating the use of land for purposes, such as residential, industrial, commercial, agricultural, recreational;
- b) Proposals for designation of land for public purpose, such as schools, colleges and other educational institutions, medical and public health institutions, markets, social welfare and cultural institutions, theatres and places for public entertainment, or public assembly, museums, art galleries, religious buildings and government and other public buildings as may from time to time be approved by the State Government;
- c) Proposals for designation of areas for open spaces, playgrounds, stadia, zoological gardens, green belts, nature reserves, sanctuaries and dairies.

Other discretionary features covered in IDP are transport and other infrastructure, DCR, estimates of cost of implementing IDP, estimates of revenue likely to be generated through various fees, charges and premium.

2. EXISTING PROFILE OF IDP AREA

2.1 INTRODUCTION

The chapter describes the location and regional setting of IDP Area. It also briefly describes the topography, soil conditions, climate, and geomorphology and current demographic characteristics. The chapter also presents a brief description of existing land use of the IDP area including residential, commercial, industrial, agricultural, water bodies, forests, hills, vacant lands etc, based on analysis of existing land use survey and field observations. Further, assessment of social infrastructure facilities is also described including education, health, socio-cultural facilities to understand the availability of infrastructure in 23 villages. Besides, status of existing physical infrastructure such as water supply, sewerage, storm water drainage, solid waste management and power supply has been assessed.

Furthermore, existing road network with respect to NAINA and MMR has been given to understand the connectivity to other areas. Navi Mumbai is one of the vibrant sub-regions in MMR in terms of population and employment growth. MMRDA, CIDCO, MSRDC, etc. have planned number of transportation projects to provide the regional connectivity to Navi Mumbai sub-region. Some of the major projects planned through various studies in the past which are relevant for the area have also-been briefly described.

2.1.1 LOCATION, REGIONAL SETTING AND ENVIRONMENT AREA AND LOCATION

As mentioned in Chapter-1, the IDP area comprises 23 villages and accounts for about 6.36% of total NAINA area (56,1,72 haSq.Km²). All these villages are from Panvel Taluka of Raigad District. The IDP area is located near New Panvel town, ONGC colony and Kalamboli junction. Major landmarks in the IDP area are Chikhale Railway Station and Palaspe Junction. The major roads passing through this area are NH-4, Panvel bypass road and Mumbai-Pune expressway. Geographical location of IDP Area is shown in Annexure 2-1.

2.1.2 REGIONAL SETTING

In terms of geography, the <u>region_IDP</u> area extends from Adai, Akurli, Koproli and Nere villages in the North to Palaspe, Derawali and Kon at the South. The east-west spread is about 5 km from Vichumbe to Moho. The region is a mix of flat and hilly areas with Kalundre, Kirki and Gadhi rivers passing through and number of natural water bodies exists within the villages.

The area of IDP is located in the rapidly urbanising zone of NAINA around Panvel. Panvel Railway Station is the nearest and most efficient transit facility for the area. Majority of the villages are connected with and dependent on Panvel railway station for regional connectivity. Peripheral villages like Chikale, Moho, Palikhurd, Bonshet, Vihighar, and Nere are distant from Panvel railway station. Villages such as Kolkhe, Derawali, Kon, and Palaspe are connected by NH-4 and NH-17.

2.1.3 TOPOGRAPHY

The hill ranges are along Akurli and Adai villages (elevations ranging from 101 to 232 meters from MSL) while other parts are generally flat lands. Major hills are also between Chikhale, Moho and Palikhurd villages (elevations ranging from 71m to 89m from MSL). Map showing slope gradient of IDP area is shown in Annexure 2-2.

2.1.4 SOIL CONDITIONS

Soils in IDP area are formed from the Deccan trap. Depending on the topographical location, various types of these soils are grouped as khar or salt, coastal alluvial and lateritic soils. The forest soils are not used for agricultural purposes but yield valuable forest products such as teak-wood, hirda (Myrobalan), beheda, pepper, etc. However, these soils are heavily eroded due to grazing and cutting of the forest trees.

Major part of the IDP area is covered by the rice field, which are loamy in texture; yellowish or reddish grey in colour, neutral in reaction and almost devoid of lime. They are formed from the trap rock from the Sahayadri ranges under heavy rainfall and humid climatic conditions. The sub-soil water level is only 3 to 5 m deep. The salt contents of the well water are higher in due to the proximity of the sea; but due to excellent drainage, its use has not produced any deleterious effects. The soils are almost neutral or slightly on the alkaline-side of neutrality.

2.1.5 GEOMORPHOLOGY

Raigad region has predominantly dark volcanic lava flows and laterites. These are spread out in the form of horizontal sheets or beds and constitute the innumerable spurs, hills and hill ranges; bold, flat topped ridges; lofty peaks and plateaus with impressive cliffs. These hill ranges and plateaus form a part of the Western Ghats. In the plains and valleys the lava flows occur below a thin blanket of soil of variable thickness. Because of their dominantly basaltic composition and the tendency to form flat-topped plateau, the lava are termed plateau basalts. Since these basaltic lava flows cover an extensive region in the Deccan and frequently present step-like appearance to the hills and ridges they are commonly termed as "Deccan traps". The traps attain a thickness of nearly 750 to 850 m around Matheran and Raigad plateaus, respectively.

2.1.6 CLIMATE

The general climatic regime is fairly equitable since seasonal fluctuations of temperature are not significantly large. The moderating effects of the nearby sea and the fairly high amount of relative humidity in the atmosphere have restricted the variability.

- **Temperature:** The maximum day temperature ranges in between 28°C to 32°C while the minimum temperature ranges in between 17°C to 27°C.
- Rainfall: Majority of the rainfall in the region is from the South–West monsoon between June and September. In Raigad district, the average annual rainfall for the district as a whole is 3,028.9-mm-(119.25"). The rainfall increases rapidly from the coast towards the Western Ghats on the eastern border of the district.

2.2 DEMOGRAPHIC & ECONOMIC PROFILE

2.2.1 POPULATION GROWTH

The IDP area has a population of 65,063 with an annual average growth rate (AAGR) of 6.7% as per 2011 census. The area has recorded fast growth since 1981, which is evident from Figure 2-1 Figure 2-1. Among the 23 villages, Devad has recorded the fastest growth (19.7%) followed by Vichumbe (19.3%). and Koproli the lowest (0.5%). Population of villages located near to Panvel railway station and having good connectivity and accessibility have larger population.

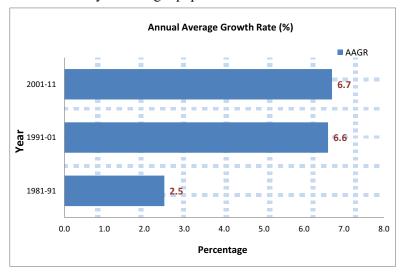

Figure 2-1: Annual Average Growth Rate of Population of IDP Area (%)

These villages are closely knit together and densely developed due to the provisions of 200m urban village schemes. The annual average growth rate in IDP area is shown in Table 2-1 Table 2-1. Population distribution within IDP area is given in Annexure 2-3.

Table 2-1: Population and Annual Average Growth Rate, 1981 to 2011

| CLN. | \$7°11 | Population | Population | Population | Population | AAGR (%) | | |
|-------|----------|------------|------------|------------|------------|----------|---------|---------|
| Sl.No | Village | 1981 | 1991 | 2001 | 2011 | 1981-91 | 1991-01 | 2001-11 |

2.2.2 POPULATION STRUCTURE AND DISTRIBUTION

2.2.2.1 POPULATION DENSITY

The IDP area is closely located near Panvel urban area. Majority of population distributed in Gaothans and spread sporadically at peripheries of villages. Villages including Palideved, Shilottar Raichur, Devad and Vichumbe are densely populated and areas within 200m from Gaothans are relatively fast growing areas in the IDP area. Average population density recorded in IDP area is about 18 persons per hectare. Palideved and Shilottar Raichur villages are highly dense with density of 226–225 and 116–115 persons/ha respectively (Refer Annexure 2-4). Figure 2-2 Figure 2-2 ppresents the population density by village in IDP area.

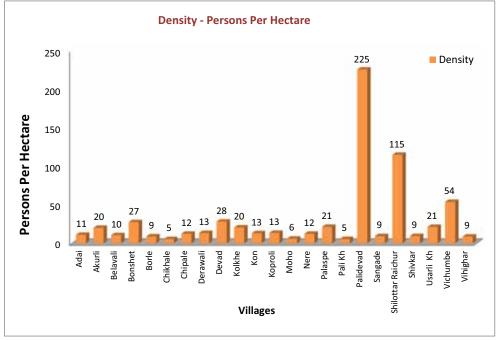

Figure 2-2: Population Density – Persons Per Hectare

2.2.2.2 SC & ST POPULATION

The share of Scheduled Castes (SCs) and Scheduled Tribes (STs) population account for 9.4% and 3.4% respectively. Amongst all villages, Palideved has the highest share of SC population (18.7%), followed by Vichumbe with 16.6%. Amongst STs, Derawali village has the highest share (17.2%) followed by Palideved with 13.5% (Refer Annexure 2-5 for SC and ST population by village).

2.2.2.3 LITERACY RATE

The IDP area has an average literacy rate of 73.8%, which is relatively high than the State and National average literacy rates of 72% and 64.8% <u>respectively</u> as per 2011census. Among all villages, Palideved has highest literacy rate of 81.8% followed by Shilottar Raichur (78.5%), and Chipale (78.5%). Refer Annexure 2-6 for literacy rates by village.

2.2.3 ECONOMIC BASE

In general, economic base of the villages is non-irrigated agriculture and its allied activities. However, The villages located near Panvel area and along NH-17 and NH-4, have some service and manufacturing industries. This section presents briefly on major economic activities, occupational structure, workforce participation rate and employment pattern of IDP area as observed in census 2011.

2.2.3.1 MAJOR ECONOMIC ACTIVITES

The major non-agricultural economic activities such as logistic hubs, warehousing, other service industries are mainly concentrated in Kolkhe, Derawali and Palaspe villages. NH-17, NH-04 and Diva-Panvel rail line are the major transportation networks passing through these villages have created opportunities to develop these non-agricultural economic activities. Restaurants, hotels, banks, brick kilns have developed along either side of the Panvel-Matheran road at Palideved and Shilottar Raichur villages.

Devad, Vichumbe and Usarli Khurd are the villages influenced by Panvel given its local level commercial activities. Agricultural activities, local commercials such as flour mills, iron gills and fence fabrication units, brick kilns, construction activities are the other non-agricultural activities in rest of villages.

2.2.3.2 OCUPATIONAL STRUCTURE AND WFPR

The workforce participation rate (WFPR) in the IDP area is nearly 40% with a total of about 25,350 workers. Among the total workers, 87.4% are main workers and remaining are marginal workers. Bonshet and Chipale villages have the highest percentage of WFPR of 48% and 46% respectively. The work participation rate in this area reveals the predominance of migrant workers (see Annexure 2-7). Workforce participation rate is given in Figure 2-3 Figure 2-3.

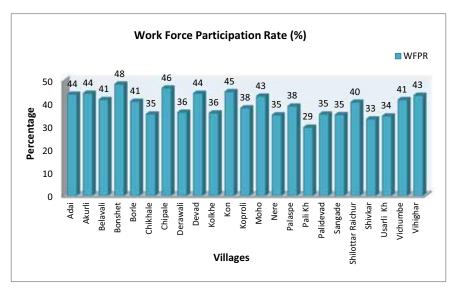

Figure 2-3: Work Force Participation Rate (%)

2.2.3.3 EMPLOYMENT PATTERN

Of the total workers of 25,350 in the IDP area, 13.4% of workers are engaged in cultivation, 3.8% of workers are agricultural <u>labourers workers</u>, 3.8% are household <u>labourers workers</u> and 79 % are others. Details of non-irrigated agriculture employment are given in Annexure 2-8.

2.3 EXISTING TRANSPORTATION NETWORK

2.3.1 REGIONAL ROAD NETWORK

The area is well connected mainly by inter-city roads (NHs, SHs, MDRs/ ODRs) with various Municipal Corporations/Councils and villages located in rest of NAINA and MMR. Existing road network of the area and connectivity to the rest of NAINA and MMR is given in Annexure 2-9. National Highways, State Highways and Mumbai-Pune Expressway are the major corridors which provide fast transport connectivity within the IDP Area.

The area has about 62.2 km of major road network which are inter-city/ sub-regional roads providing connectivity between IDP area and rest of NAINA and MMR. NH-04 and NH-17 and and State highway 54 several State Highways traverse through this area. In addition, Mumbai-Pune Expressway also traverses through the area. It is important to mention that the area has good regional connectivity with Greater Mumbai and rest of MMR_x. MMR.

The Mumbai-Pune Expressway, NH-4 and NH-17 are fairly maintained as they are the major regional roads. The condition of major roads is good as these are well maintained in most cases. The State Highways in the area, the most important being Panvel Matheran Road (SH-54) is narrow and is inconsistently maintained.

Of the total road network, National Highways (NH-4 and NH-17) together constitute nearly 8.8 km (14%) while State Highways make up for about 6.6 km (10.6%) of the total length. Besides National Highways and State Highways, nearly 6.4 km (10.3%) of the Mumbai-Pune Expressway also passes through the area. Major District roads constitute for 0.1 km (0.2%) and other roads aggregating to a

length of about 40.3 km (64.8%) also passes through the area. A detailed breakup of the transportation network is presented in <u>Table 2-2</u>Table 2-2.

Table 2-2: Major Road Network Details in IDP Area

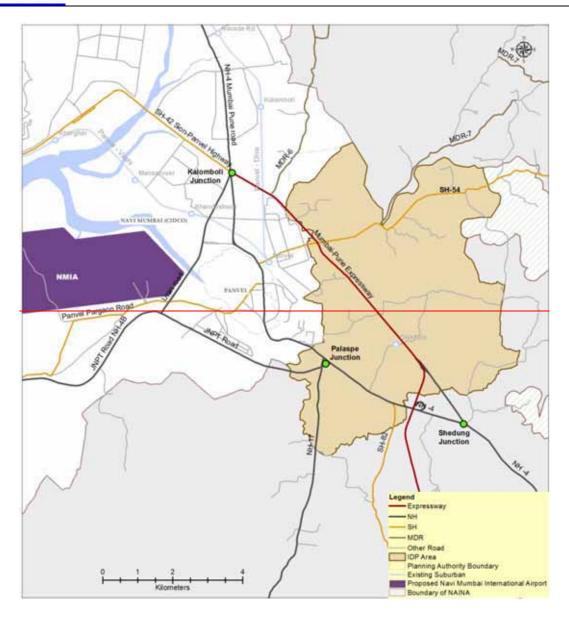

| Road Category | Length in km | Percentage |
|----------------------|--------------|------------|
| Expressway | 6.4 | 10.3 |
| National Highways | 8.8 | 14.1 |
| State Highways | 6.6 | 10.6 |
| Major District Roads | 0.1 | 0.2 |
| Other Roads | 40.3 | 64.8 |
| Total | 62.2 | 100 |

Source: Based on the <u>available base map prepared for IDP</u>. available base map

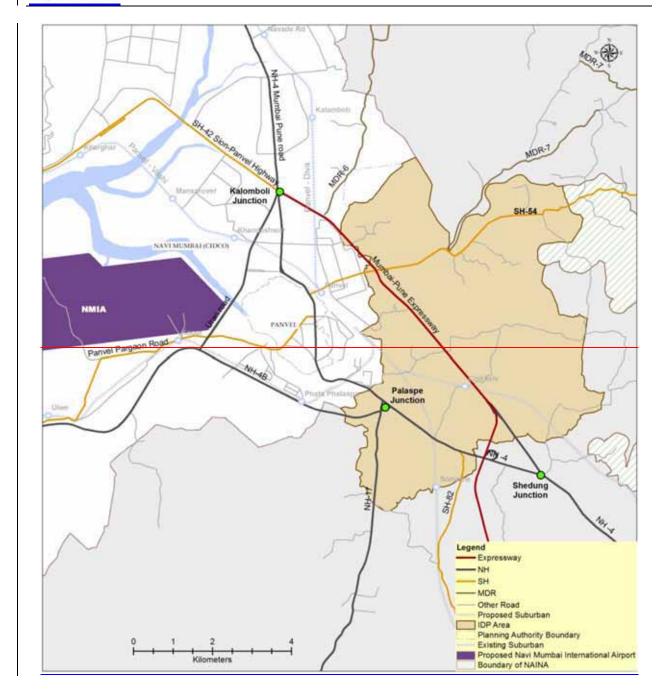

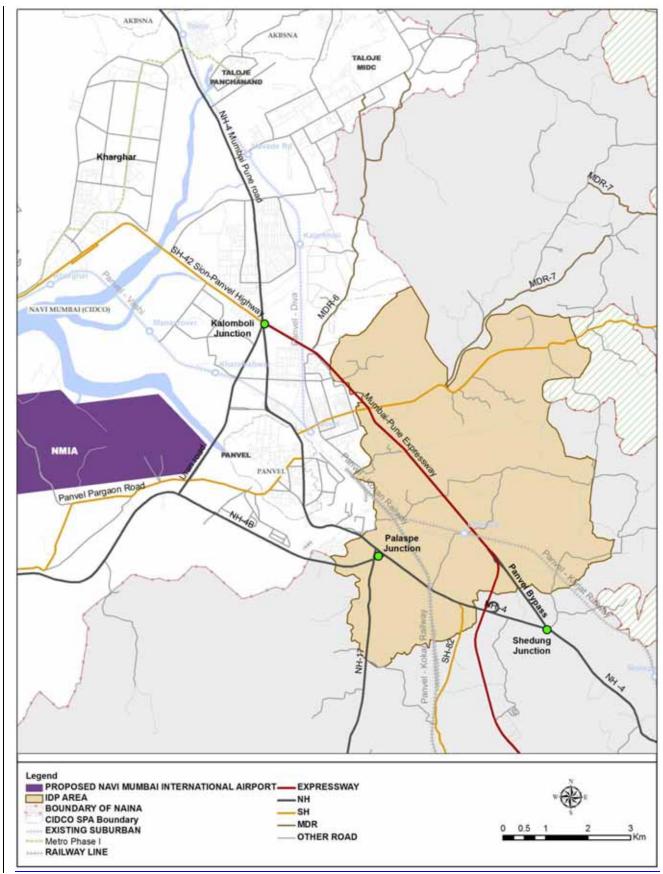

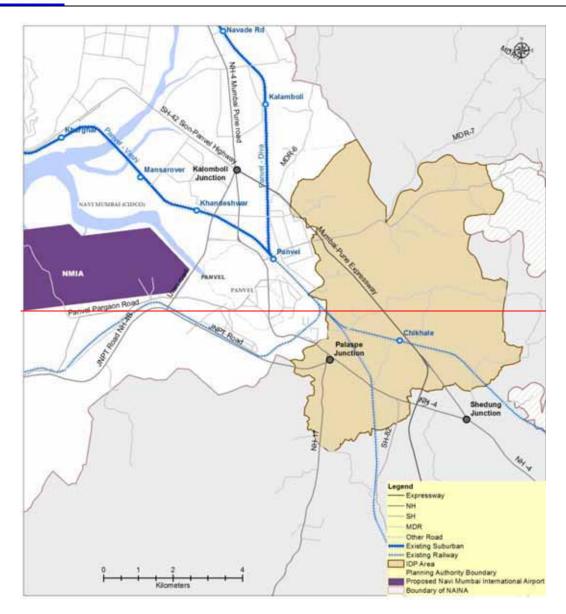

Figure 2-4: Existing Road Network within IDP Area

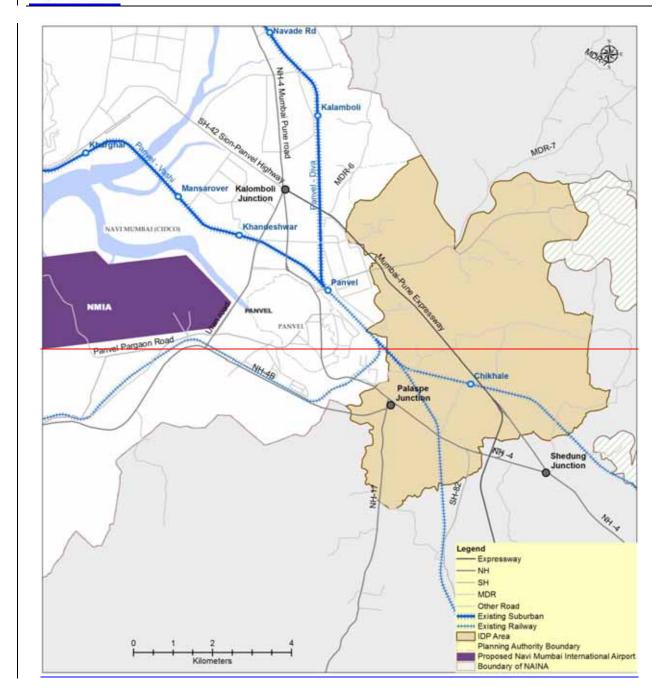

2.3.2 REGIONAL SUB-URBAN RAIL NETWORK

There are no existing suburban rail operations within the IDP area. However, Central Railway provides suburban rail services between Island city and Navi Mumbai through harbour line. The IDP Area is served by very limited suburban railway network i.e. through CST-Panvel suburban railway line, Vashi-Thane suburban railway line and shuttle services on Diva-Panvel and Diva-Vasai-Virar corridors (see Figure 2-5Figure 2-5). Total length of railway traversing through the area is about 9 km. The existing Panvel-Karjat line is about 5.3 km and the Panvel-Wadkhal line is about 3.7 km. presently these lines facilitate inter-city passenger and freight services. Suburban services are proposed along these lines.

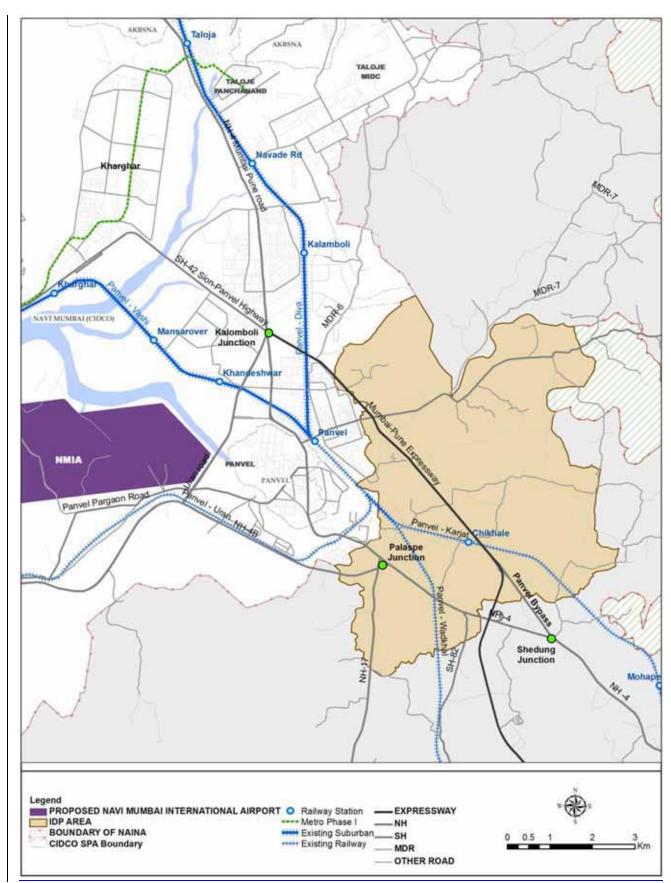

Figure 2-5: Existing Railway Network within IDP Area

Following are the important proposed/ committed areas of development under several past studies undertaken which would directly impact the IDP area (see Annexure 2-10).

- a) **Proposed Road Network:** IDP Area shall have an enhanced regional road network connecting several parts of MMR and beyond with the following proposed/ committed road network;
 - Mumbai-Vadodara Spurspur: The alignment of Mumbai-Vadodara Spur in MMR is under implementation by NHAI which starts in Virar and ends in Panvel. This corridor has been planned for fast movement of port related inter-city traffic (JNPT);
 - Multi-Modal Corridor (MMC): One of the major recommendations of Comprehensive Transport Study of -MMR was the concept of development of MMC in MMR. MMRDA has planned MMC from Virar to Alibag (about 140 km) following the existing as well as the proposed highway corridors to provide a faster connectivity with the ULBs located outside Greater Mumbai and increase the accessibility to inter-city freight traffic. MMRDA initiated the detailed feasibility study for the MMC corridor and the study is in progress. Part of the MMC traverses through the area and it provides good regional connectivity to NMIA as well as rest of NAINA;

In addition to above regional road/ highway connectivity, the IDP Area would include the new arterial/ sub-arterial/ local roads to provide the local travel needs and sub-regional travel needs.

b) Proposed Transit (Suburban and Metro) Network

- Metro Rail: Presently, there is no Metro line operational in the area. Metro lines proposed in Navi Mumbai will impact the growth and connectivity of the IDP area. CIDCO has undertaken construction of the first Metro line in Navi Mumbai from Belapur to Pendhar which is proposed to be extended southwards up to NMIA. Also additional metro corridor between Mankhurd and Ghatkopar has been proposed which will be extended up to Panvel via NMIA, thus providing a fast metro connectivity between eastern suburbs of Greater Mumbai and Panvel. As part of the present study, it is proposed to extend the Mankhurd-NMIA-Panvel metro line into IDP.
- O Suburban Rail Connectivity: Existing Diva-Panvel line and Panvel-Karjat-Khopoli line are proposed to have regular suburban commuter transit as part of priority projects by MRVC. Anticipating huge population and employment growth in Navi Mumbai and surrounding areas and upcoming NMIA, MRVC has carried out detailed techno-economic feasibility for suburban operations from Vasai to Diva and Diva to Panvel as well as in-house technical feasibility study for the operation of suburban rail services from Panvel to Karjat as this corridor would serve the local as well as regional commuter traffic.
- c) Proposed MTHL: The proposed Mumbai Trans Harbour Link (MTHL), which connects Sewri (in Island city of Mumbai) to Nhava Sheva (Main land) is planned with the basic objective of (a) development of Mainland and reducing pressure on Mumbai City; and (b) facilitate decongestion efforts by Improving connectivity between Island city and main land. MTHL along with Eastern Freeway (which is recently opened for traffic) on Island city side and existing & planned new roads (ex. Coastal road) on Main land side would provide fast connectivity to proposed NMIA and NAINA.

- d) Proposed NMIA: Potential catchment of the NMIA is expected to be mainly MMR and areas neighbouring MMR. The pressure on Mumbai airport is not likely to get reduced in the coming years and Pune and Nagpur airports have very limited international flights. Thus the inflow of passengers to the NMIA is expected to be high and as a result the surrounding areas will have the potential for development.
- e) **DMICDC:** Government of India (GoI) envisages developing dedicated freight corridor (DFC) between Delhi and Mumbai (originating from JNPT). Under this project, four strategic zones were identified viz. Zone A: Mumbai Metropolitan Region, Zone B: Potential Development Region, Zone C: Potential Growth Corridors and Zone D: Spill over Growth Region. The current NAINA & KNT fall under Zone C and Zone D of the DMICDC region, which adds to development potential.

2.3.3 LOCAL ROAD NETWORK

The local road network is primarily formed by the dense village roads that connect the existing Gaothan settlements to each other. These roads are not more than 6 m in width in most cases. The Panvel-Matheran Road (SH 54) and proposed SH 103⁴) in the north acts as major connector for many Gaothan settlements such as Shilottar Raichur, Palidevad, Akurli, Chipale, Koproli and Nere. Another road in the north-south direction passing through Sangade, Belavali, and Pali Khurd and Nere villages connects Panvel Matheran road (SH–54) to Shedung Junction. The connectivity to existing settlements from Mumbai-Pune Expressway needs crossing-over. Underpasses and over bridges are present in various locations to facilitate the same. Within the settlements, vehicular roads are minimal and pedestrian pathways form the network. Village level road network in shown in Annexure 2-11.

Some village roads in the intensely developed areas near the major regional roads are well-developed and well-maintained. Village roads that are comparatively in the interior areas away from major regional roads are mostly narrow kuccha roads. The pedestrian pathways within the settlements are well maintained and paved in some cases.

Existing Condition of village roads in intensely developed villages

-

¹ Road Development Plan 2001-2021, Raigad District Panvel Taluka (PWD)

Existing Condition of village roads in the interiors

2.3.4 BUS SYSTEM SERVICES

The important bus services used are from the New Panvel Bus Depot and N.M.M.T. Bus Stand in New Panvel to the west of Village Shilottar Raichur and the Bus stand near Shedung Junction. These are outside the IDP area. Palaspe Phata Bus <u>Station Stop</u> in Kolkhe village is a major location for bus services within the IDP area. The services from Palaspe Phata Bus <u>Station stop</u> provide <u>connectivity</u> for Kolkhe and Kon villages along NH-4 and Palaspe along NH-17. The bus services from New Panvel provide services to some villages along Panvel Matheran Road.

The villages along Panvel Matheran Road that have bus services are Shilottar Raichur, Palidevad, Koproli and Nere. Shedung Bus Depot provides bus services in the north-south direction up to Panvel-Matheran Road (SH 54) in village Nere passing through Sangade and Belavali villages in the IDP area. Palaspe Bus Stand along the NH-17.—The NMMT provides services from Vashi to Khopoli along NH-4 and buses are available from Palaspe bus stand near NH-17 and from Panvel to Karjat, Khopoli and Rasayani. No known bus services are available in Chikhale, Moho, Shivkar, Borle, Pali Khurd, Bonshet, Vihighar, Chipale, Adai, Akurli, Devad, Vichumbe, Usarli Khurd and Derawali villages. In some villages, where areas are well developed private bus services have been in operation for example provided as in the case of Mahalaxmi Nagar in Nere village.

2.3.5 LOCAL SUB-URBAN RAILWAY NETWORK

The existing railway lines with in IDP area do not provide suburban rail services. Suburban services are proposed along Panvel-Karjat and Panvel-Wadkhal lines. There is An-an existing railway station is at present in Chikhale village.

2.3.6 TERMINAL FACILITIES

Bus Terminal facilities such as Palaspe Phata Bus Station in Kolkhe village are present. Nearby Bus Terminals are New Panvel Bus Depot and NMMT. Bus Stand in New Panvel to the west of Village Shilottar Raichur and the Bus Stand near Shedung Junction are present.

2.3.72.3.6 PARKING FACILITIES

There are no formal public parking areas in the area. Private vehicles such as cars and two-wheelers are parked within private plots of the owners. Privately owned/ maintained truck parking facilities available in Palaspe and Kolkhe villages.

Localised Parking Areas available within villages

2.3.82.3.7 **SUMMARY**

It is expected that, once the Navi Mumbai International Airport is developed, which is going to trigger the growth of the area, the traffic characteristics are expected to undergo a major change. In addition, the development within the area would need further development of transport network and enhanced regional transport connectivity through suburban rail expansion, metro corridors, and highway corridors.

2.4 EXISTING LAND USE

<u>CIDCO</u> carried out Topographical and Existing Land Use Survey for this area. Following sub sections briefly explains about how the survey was carried and methods used.

2.4.1 DATA COLLECTION

For the purpose of preparation of Development Plan, CIDCO procured satellite imagery. CIDCO collected forest land information from MMRDA, which was compiled by MMRDA and ratified by Forest department at the time of revision of Regional Plan for Mumbai Metropolitan Region. Development permission information was collected from ADTP Raigad. And also procured cadastral maps (village revenue maps) from DILR/TILR.

2.4.2 BENCH MARK SURVEY

Temporary Bench Mark (TBM) was available. Near well in Bhengari village (500 meters from ONGC Kalundre bus stop towards west). Considering this as a reference location, establishment of 10 Bench Mark (BM) points over an interval of about 2.5 km across 2.5 km of stretch of NH-4 was done. The location map of bench marks is given in Figure 2-6.

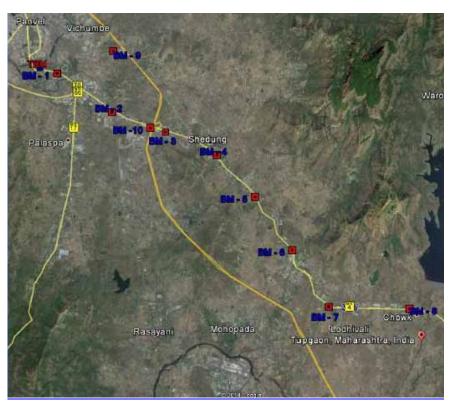

Figure 2-6: Bench Mark Locations across NH-4 in NAINA

2.4.3 GCP COLLECTION

Ground Control Points were collected at several locations by using Leica and Trimble receivers to accurately find out the coordinate of physical features. Such features include road intersections, corners of open field or boundary etc. In surveying/ mapping projects, ground coordinates of map features are generally determined based on these ground control points. Therefore, it is mandatory to establish GCP network at higher order of accuracy to achieve the desired accuracy in final mapping matching the specifications. Ground Control Points (GCPs) database is established for following:

- Geo referencing of high resolution satellite images;
- Cadastral Sheet / Village Maps Geo-referencing;
- LiDAR Scan Registration; and
- Placement of Permanent Bench Mark (Monument/Pillar).

Following steps are involved in collection and processing of GCP data:

- Identification of points on satellite imagery;
- DGPS observation for selected GCP positions on ground; and
- Transfer of DGPS data in the required format for post processing.

Table 2-3: Details of Ground Control Points

| Purpose of Control Point | <u>Number</u> | DGPS used |
|--|---------------|-----------------------------|
| Geo referencing of High resolution satellite images. | <u>65</u> | Leica GS10 and Trimble 5700 |
| Cadastral Sheet / Village Maps Geo referencing | <u>667</u> | Trimble Geo XT |

| <u>LiDAR Scan Registration</u> | <u>549</u> | <u>Leica GS10</u> |
|---|------------|-------------------|
| Placement of Permanent Bench mark (Monument/Pillar) | <u>10</u> | = |

2.4.3.1 BASE STATION

Two DGPS receivers of Leica and Trimble make were deployed as base station. Initially observation was made for about 8 to 10 hours to get the precise coordinates of the base stations. Thereafter, these precisely known locations were used as base stations and were observed during the daily field operation.

2.4.3.2 **ROVER**

DGPS receivers of Leica and Trimble make were deployed as rover. It was set up on or nearby planned location for 30 to 35 minutes to acquire GPS signals. The base station receiver calculates its position based on satellite signals and compares this location to the precisely known location. The difference is applied to the GPS data recorded by the roving GPS receiver to improve the accuracy.

2.4.3.3 GCP DATA PROCESSING

The recorded DGPS observations were post processed and network adjustment was performed using Leica Geo Office tools and Trimble business centre. The network adjusted geo-coordinates were provided in UTM projection system with WGS 84 spheroid and WGS 84 datum.

2.4.4 IMAGE PROCESSING

The data validation, image processing was carried out to ensure the completeness and quality of data. Multi spectral imagery of 2 metre spatial resolution and Panchromatic of 0.5 meter resolution were fused to generate a color composite imagery at the spatial resolution of PAN imagery. Geo-referencing of satellite imagery was carried out with reference of GCP.

The details of satellite image are given below:

- Imagery date 3rd Nov 2012, 3rd Dec 2012, 29th Jan 2013
- Product ____ Panchromatic (black and white) AND Multi_spectral
- Bit depth 16 bit
- Ground sample distance (Resolution) 0.5 m (Panchromatic & Pan sharpened)

Meter

• Spatial reference system

Units

- Projection UTM Zone 43N
 Datum WGS 84
- O Butum WOS 01

2.4.5 DIGITIZATION AND DATA PROCESSING

The Cadastral maps (Village maps) were procured from DILR/TILR were digitised and geo-referenced by using about 5 ground control points per village. Administrative boundaries were also geo-referenced. Basic digitization is carried out and the information is classified into different layers. Thereafter, field surveys were conducted. See Figure 2-7 for map showing digitized features on satellite imagery.

Figure 2-7: Map showing digitized features on satellite imagery

2.4.6 METHOD OF FIELD SURVEYS

Field surveys were carried out to verify the existing land use plan and base map at ground level. The entire area is divided into grids of 1:1600 scale. The surveyors were deployed on field with the grid maps to capture the attribute details.

Each structure/ building foot print was attempted to classify the land use category and at the same time the geographical features such as water bodies, hills and vegetation were observed and marked on the map. Addition/ deletion of features such as roads, buildings, took place at the time of survey. All the attributes were marked in a separate code on the satellite imagery and detail information was then plotted into the attribute sheet. After completion of field surveys the digitization/ drafting of all corrections was carried out. Thereafter, Geo-database structure was prepared.

2.4.7 LIDAR SURVEY AND DATA PROCESSING

The cadastral map is a basic data that prescribes land parcel numbers, classification of land category, and the boundaries and ownerships of land parcels. The scanned cadastral map and satellite images were georectified and the projection was set to Universal Transverse Mercator (UTM) projection system, zone 43N. The nearest neighbourhood Re-sampling technique was used to re-sample the cadastral map into a pixel size of quick-bird image during the image-to-map registration. All land parcels were digitized using Arc GIS 9.3.

2.4.7.1 LIDAR DATA PROCESSING

Contour lines are the most common method of showing relief and elevation on a standard topographic map. A contour line represents an imaginary line on the ground, above or below sea level. All points on the contour line are at the same elevation. The elevation represented by contour lines is the vertical distance above or below sea level. Contours at 1 meter, 2 meter and 5 meter interval have been derived from the DEM. It has been generated based on the filtered and edited LiDAR data / (bare earth) incorporating streams and break lines and points.

Cartographically, the intermediate contours and every fifth contour have been drawn with different thickness and contour values at appropriate distances to enhance contour readability and indicating the index contour. Starting at zero elevation or mean sea level, every fifth contour line is a heavier line. Each index contour line is numbered at its centroid indicating the elevation of that line. This number is the elevation of that line.

2.4.8 QA AND QC PROCESS ADOPTED

The QA and QC process was adopted which includes manual checks as well as automated routines. Automated process includes the verification of no duplication of lines or symbols, no object with more than one unique identifier, no breaks in graphic connectivity. All graphic files were checked manually with reference to original source map.

The existing land use forms the basis for preparation of IDP and is mandatory as per MR&TP Act, 1966. This section on existing land use presents methodology adopted for carrying out survey, analysis of various land uses etc.

2.4.1 SURVEY METHODOLOGY

CIDCO appointed an agency to carry out existing land use (ELU) survey for the part area of NAINA. Extent of area covered under the scope of ELU survey is 294 sq.km. This IDP area is part of ongoing ELU survey area.

2.4.2 SCOPE OF SURVEY

The broad scope of existing land use survey entrusted to a survey agency is as follows;

- a) Topographical Survey using Laser Scanning (LiDAR) Technology
- b) Collection of Ground Control Points
- c) Carrying out and setting up bench marks & reference pillars / stones
- d) Contouring
- e) Land Use survey
- f) Data Processing: All types of Data collected / generated / procured
- g) During the survey shall be processed with Digital Elevation Model (DEM),
- h) Digital Surface Model (DSM) & Processing of Cadastral plans, Satellite Image Processing
- i) Preparation of Survey plans / Base map.
- i) Preparation of Existing Land Use Map

2.4.32.4.9 DISTRIBUTION OF LAND USE

The major land use in the IDP area is non-irrigated agriculture. Environmentally sensitive areas such as forests, hills and water bodies are present. Existing built-up area includes residential, commercial, industrial, public and semi-public land uses. The development within the IDP area is sparse. Comparatively, dense development is in Gaothans. Table 2-4-Table 2-3 shows a detailed area statement for the IDP Area.

Table 2-4: Area Statement of Existing Land Use (in Ha)

| <u>Sl. No.</u> | <u>Land Use</u> | Area in Ha. | % of Total IDP Area |

 ${\it Source: Based on ELU Survey}$

The land uses are described in brief.

Largely the area is under agricultural use with 54.71%. Especially the land around Gaothans is primarily agricultural. The agricultural land falls in four categories; cropped land, fallow land, poultry farms and plantation/vegetated land.

The dense residential areas are in 23 Gaothans within Gaothans. High-rise apartment buildings have developed around Gaothans. The residential development away from Gaothans is sparse. The area under residential use is 11.1752% of the total IDP area.

The commercial activities are concentrated along the NH-4. Few commercial uses are also observed along NH-17 and SH-54 (Panvel-Matheran Road). The land under commercial use amounts to 99.36 Ha (2.7%).

Large industrial areas of logistic activities are observed at Palaspa Junction and Palaspa area. Some scattered industrial uses are also seen in the area. These areas amount to 66.53 Ha (1.8%) of the total IDP area. The public and semi-public amenities include the social infrastructure in the IDP area. It includes educational, health care and socio-cultural facilities in the area. The total land under these uses is 18.38 Ha which is approximately 0.5% of the total IDP area. The public utilities include the water supply system, sewerage system, storm water drainage, power supply and solid waste management. The utilities also include necessities such as bus terminus facilities, water treatment plants, overhead water tanks, electric substations, etc. in the IDP area. The area of public utilities in the IDP area is 1.75 Ha (0.05%) which is inadequate. The existing land use pattern within the IDP area is shown in Figure 2-6.

The IDP area comprises a few environmentally sensitive areas such as forests, various water bodies and hills. The details for the same are given below.

a) Forests:

An area of of 230222.00 Ha is under forest as per cadastral records. It is 6.20% of the total IDP area.

b) Water bodies:

Total area of water bodies in the IDP area is 8682.0092 Ha which includes rivers, lakes, ponds and perennial streams. The important rivers flowing through the IDP area are Kalundre/ Gadhi River and Kirki River. The area under water bodies is approximately 2.42% of the total IDP area.

c) Hills:

Total area of hills in the IDP area is 158.62 Ha. The hill slopes are steep in most areas. Area of hills with slope of 20% and above is 148.96 Ha while the remainder of hills is 9.65 Ha with gradual slopes. Hills are 4.3% of total IDP area.

The IDP area has fairly large parcels of vacant land i.e. where no particular activities take place and are not under any specific use. The area of such land is 423.87 Ha, which amounts to 11.5% of total IDP area.

The IDP area also has other land uses such as mixed use, recreational spaces and quarry. The land under these uses is very less.

a) Mixed Use:

This category of use includes land where a number of uses take place simultaneously such as residential and commercial or any other. Land under such uses is 26.90 Ha which is 0.73% of the total IDP area.

b) Recreational Spaces:

The area of land under recreational uses such as playgrounds, parks, gardens, etc is negligible in the IDP area. It is 14.21 Ha which amounts to only 0.4% of the IDP area.

c) Quarry:

A small land area is used for quarrying which is 0.08 Ha which amounts to be negligible percentage.

The transportation network in the area includes the road network and railway network the details for which are given below.

a) Roads:

A number of major roads traverse through the IDP area. The Mumbai-Pune Expressway passes through the area. National Highways, NH-4 towards Khalapur, NH-4B towards JNPT and NH-17 towards Goa also pass through the area. The Panvel-Matheran Road (SH-54) passes in the north in the east-west direction. The local network is formed by the major district roads, other district roads and village roads.

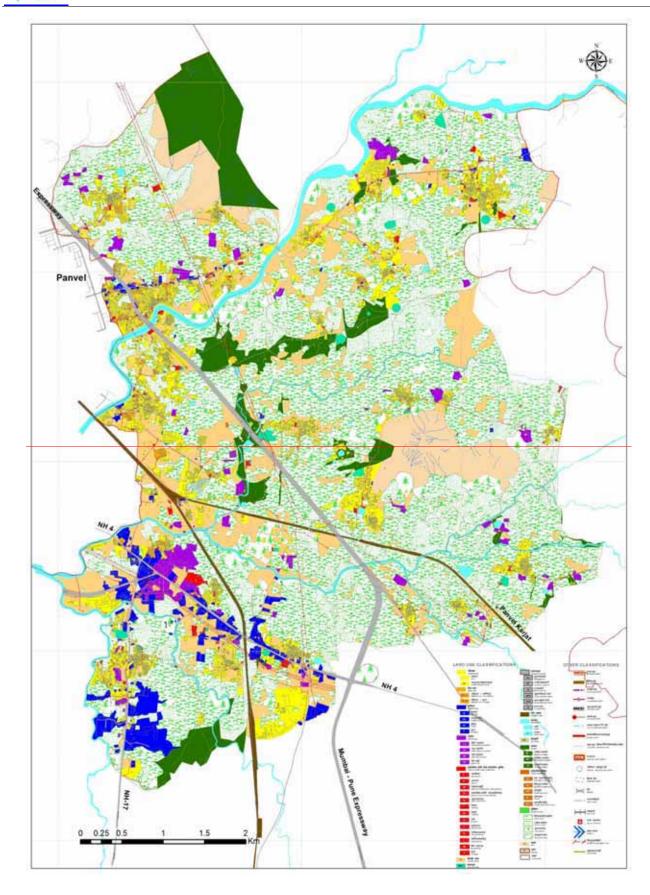

b) Railway:

The existing railway lines in the IDP area are Panvel-Karjat line and Panvel-Pen line of the Konkan Railway. There is presently no suburban rail network in the IDP area. Chikhale Railway Station is present in the central part of IDP area.

The total area of transportation in the IDP area is 129.63 Ha, which is 3.5%. The details of transportation network are explained in subsequent sections. The IDP area also has a number of proposals from the CTS study and other authorities for roads, railway services and metro services.

Legend used for showing existing land use is shown in Annexure 2-12.

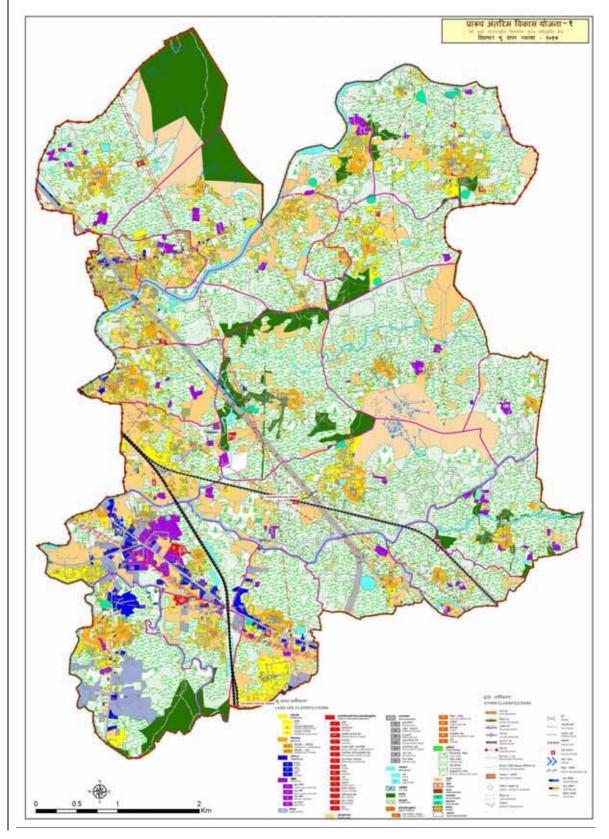

Figure 2-8: Existing Land Use Distribution in IDP Area, 2014

2.4.42.4.10 LAND AVAILABLE FOR DEVELOPMENT

The land available for development has been calculated based on the existing land uses mentioned and detailed in the section above. Environmentally sensitive areas such as water bodies and forests are excluded. Physically undevelopable areas such hills with steep slope (20% slope and above) are not included in the developable area. Land under existing transportation network is also not included towards developable land. Existing built-up areas are excluded from the developable land.

As derived in Table 2-4Table 2-3, the land available for development is 2463 Ha that is 67% of the total IDP area.

2.4.52.4.11 CONCLUSION

The IDP area is predominantly non-irrigated agriculture in nature. The western area of the IDP, which is in contiguity with Panvel area has maximum existing built-up area. The IDP area has no organized recreational areas.

Table 2-5Table 2-4_shows the comprehensive area statement for the existing land use and land available for development. All further calculations for proposed land uses are based on this land available for development i.e. 2463 Ha which is 67% of total IDP area.

Table 2-5: Summary of Land Availability in IDP Area

| Sl. No. | Description | Area (in Ha) | % of total IDP Area |
|---------|--|--------------|---------------------|
| A | Total IDP Area | 3683.00 | 100.00 |
| В | Non-developable Land | 595.60 | 16.17 |
| С | Existing built-up area | 624.27 | 16.95 |
| D | Land available for development [A-(B+C)] | 2462.86 | 66.88 |

Source: Land Use Survey, 2014.

2.5 SOCIAL INFRASTRUCTURE

2.5.1 EDUCATIONAL FACILITIES

Educational facilities such as primary schools, upper primary schools, senior secondary schools, colleges and universities are assessed. The analysis is based on the statistics collected from District Primary & Secondary education departments, Raigad district and State Board of Secondary and Higher Education, Maharashtra. A total of 20 Primary schools and 28 anganwadis are located within 23 villages of IDP area. 3 Degree colleges are located at Devad, Pali Khurd and Vichumbe villages. Village wise number of educational facilities existing is given in Annexure 2-13. Number of educational facilities available within IDP Area is given in Table 2-6 Table 2-5.

Table 2-6: Number of Educational facilities available in IDP Area

Zilla Parishad Primary and Secondary School in Shivkar Village

Primary School in Belavali Village

2.5.2 HEALTH FACILITIES

Assessment has been carried out with respect to health facilities such as dispensaries, sub-centres; primary health centres (PHCs) and rural hospitals. Health facilities have been assessed with an intention to understand the adequacy of health facilities for 2011 population. The analysis is based on the information collected from Public Health Department of Maharashtra.

There are 4 sub-centres and 20 PHCs located with minimum infrastructure facilities. Several private clinics located apart from the government facilities, which are not accounted in statistics. Few villages such as Vichumbe, Nere, Devad, Adai, and Bonshet have basic health facilities. Panvel area-is the nearest place for all kinds of health emergencies. Village wise number of available of health facilities is given in Annexure 2-14. Number of available health facilities is given in Table 2-7 Table 2-6.

Table 2-7: Number of Health facilities available in IDP Area, 2014

Private Clinic located at Belavali Village

Private Clinic located at Adai Village

2.5.3 COMMERCIAL FACILITIES

Small scale commercial establishments selling commodities of daily consumption are present in almost all the 23 villages. Commercial establishments such as grocery shops, medical shops, flour mills, vegetable shops are observed in villages. Apart from these, the major commercial activities such as Banks, Hotels and restaurants are located at Palaspe junction and along the Panvel-Matheran Road. Panvel is the nearest wholesale and retail shopping area.

Local Commercial shops located at Adai village

Local Commercial shops located at Vichumbe

2.5.4 SOCIO-CULTURAL FACILITIES

Socio-cultural facilities such as cinema theatres, sports complexes, and clubs are not observed within the villages of IDP area. However, other socio-cultural facilities such as community halls, school playgrounds etc. serve the needs. Panvel is the nearest destination for major cultural activities.

Recreational space with open stage in Vichumbe village

Community Recreational space in front of temple in Vihighar village

2.5.5 RECREATIONAL FACILITIES

Recreational areas such neighbourhood parks, city scale parks are not located within this area. However, the major source of open spaces is school grounds. Some of the Zilla Parishad schools have playgrounds attached. Some of the residential colonies, societies and housing complexes are maintaining their own parks and play grounds within their premises.

2.5.6 SUMMARY

The IDP area being semi-rural in nature does not have a well-developed social infrastructure. At present, facilities seems to be sufficient to for 2011 census population and though there is the need to be improve infrastructure in of existing social facilities.

2.6 PHYSICAL INFRASTRUCTURE

2.6.1 WATER SUPPLY

81% of the population of the IDP area has access to drinking water within habitation and around 2% of the population has water availability within villages. However, around 17% of the population has to fetch water from outside of the village from nearby sources. Around 58% of the population has access to safe water. Around 2% of the population has access to source the water from more than one water source where at least one source is unsafe. Besides, around 3% of the population is dependent on unsafe source of water. Tables showingThe drinking water source, potability and access to drinking water location are given in Table 2-8, Table 2-9 and Table 2-10Tables 2-7, 2-8 and 2-9.

The analysis has been carried out with the following important aspects of water

- Source- Ground water, Surface water
- Quality- Water is safe or not
- Distance within habitation, within village and outside of village

Table 2-8: Drinking Water Source

| Water Source | No. of Villages | Population | Population % |
|---------------------------------|-----------------|------------|--------------|
| Surface Water | 16 | 48,480 | 74.51 |
| Ground Water | 3 | 4,901 | 7.53 |
| Ground Water / Surface Water | 4 | 11,682 | 17.95 |
| Total | 23 | 65063 | 100.00 |

Source: Web Site (30-4-14)- National Rural Drinking Water Programme - Ministry of Drinking water Sanitation, Govt of India and Census 2011

In the IDP area adjoining existing Panvel 20 villages receive water from surface sources. Around 91% of the population is getting surface water.

Table 2-10: Access to Drinking Water - Location

| Water Availability | No. of Villages | Population | Population % |
|--------------------|-----------------|------------|--------------|
| Within habitation | 16 | 52,224 | 80.27 |
| Within Village | 02 | 1,557 | 2.39 |
| Outside Village | 05 | 11,282 | 17.34 |

Total 23 65,063 100.00

Source: Web Site (30-4-14) National Rural Drinking Water Programme - Ministry of Drinking water Sanitation, Govt. of India and Census 2011.

The available data indicates that within the IDP area, around 81% of the population has access to water within habitation and around additional 2% population gets it within village. However, around 17% of the population gets water for domestic use from area outside of their villages. Around 58% of the population has access to safe quality of water. Around 2% of population has access to more than one water source, and at least one of the available sources is unsafe. However, a Around 3% of the population is dependent on water sources which are not safe for domestic use. Figures showing drinking water source, safe/ unsafe, availability are given in Annexure 2-15.

2.6.2 SEWERAGE

Maharashtra is the first state in the country to launch a state-wide programme for reforming the water supply and sanitation sector. The implementation of the following reforms is an integral part of the Jalswarajya project being implemented with assistance from the World Bank in the state since 2003.

The IDP area is mainly rural in character. As on date, there is no sewerage system. In 2001, more than 60% of rural population in Raigad district was not having toilets within premises. Census 2011 indicates that the number has come down and it is varying between 45 to 60 %. However, as there is no sewerage system, generally, the toilets are connected to individual septic tanks and the effluent is disposed off in the nearby drains or opens area.

2.6.3 STORM WATER DRAINAGE

The drainage in the IDP area has not been a major issue, due to the peculiar location of the area. It has hills on one side where the rain fall received is drained with high speed of water flowing through rivulets, nallas, valleys, and rivers into the sea, falling on the other side of the area.

After development, the area ma_wouldy be susceptible for flooding because the area receives very heavy rain fall. Chitale committee report ("Fact Finding Committee Report on Mumbai Floods") explains that the annual rainfall of the meteorological sub division of Konkan and Goa (2,980 mm) is heavy. There have been instances when as much as half of the annual rainfall was recorded in a single a day. It can be understood that the IDP area will be prone to flooding after development if adequate measures are not taken in advance. Urban flooding is fundamentally different from rural flooding, as developed catchments are formed and flooding occurs in a short time. But unfortunately urban drainage is one of the most neglected areas.

2.6.4 SOLID WASTE MANAGEMENT

There is no systematic solid waste management system in villages. The waste generated in the rural area is disposed off/ dumped in the nearby area. Being within carrying capacity of the nature the same is recycled without having any adverse impact on the habitats. However, with urbanization, the scale of waste generation is likely to increase and cannot be left unattended.

2.6.5 POWER SUPPLY

The entire IDP area is provided with electricity by the Maharashtra State Electricity Distribution Company (MSEDCo) Ltd. through 22/11KV substations and lines. MSETCL operates a transmission network of 39,871 Circuit KM of transmission lines and 559 EHV Substations with 89,178 MVA

transformation capacities. This infrastructure constitutes most of the inter-regional as well as intraregional electric power transmission system in the State.

As per per the available information received during discussion with, Maharashtra State Electricity Distribution Company Ltd (MSEDCL) officials, during the discussion that all the villages have been electrified barring few padas, which were not accessible.

3. ENVISIONING FUTURE

3.1 VISION FOR NAINA

NAINA & KNT depend upon the economic base provided by NMIA at Panvel, Taloja Industrial Area and JNPT. However, all three are outside the NAINA and KNT limits having their own immediate hinterlands to capture the growth impulses of these economic inputs and the expanding housing market of Mumbai and Navi Mumbai. NAINA will have to acquire a competitive edge over other areas in MMR.

The vision for NAINA and KNT could therefore be:

"A Competitive, Inclusive and Smart City within MMR that offers enriching environment for living, learning and working"

NAINA & KNT depend upon the economic base provided by Taloja Industrial Area, NMIA and Panvel and JNPT. However, all three <u>activities</u> are outside the NAINA and KNT limits having their own immediate hinterlands to capture the growth impulses of these economic inputs and the expanding housing market of Mumbai and Navi Mumbai. NAINA will have to acquire a competitive edge over other areas in MMR.

The vision for NAINA and KNT could therefore be:

"A Competitive, Inclusive and Sustainable City within MMR that can offer enriching environment for living, learning and work"

3.2 POPULATION FORECAST - NAINA ESTIMATIONS

3.2.1 METHODOLOGY

The conventional methods of trend projection (arithmetic, geometric etc.) are not suitable for NAINA KNT (and its part areas) as the population growth is likely to occur on account of new economic inputs like NMIA, expansion of JNPT, an emerging rail link at Panvel, warehousing activities at Kalamboli and expanding housing market of Mumbai/ Navi Mumbai aided by infrastructure provision by CIDCO. Both NAINA KNT are likely to grow in the regional context of Mumbai Metropolitan Region. Therefore, "Shift in Share" method has been used to forecast the population for horizon year 2034. The shift in share method (in absence of 2011 migration information from census), also implicitly accounts for the overall migration patterns.

—Similar method was adopted for MMR Regional Plan 1996-2011. The Draft Development Plan of Greater Mumbai 2034 also adopted similar approach to arrive at future population of Greater Mumbai. This is essentially a "step down" or "from whole to part" approach. Since NAINA and KNT-are integral parts of Mumbai Metropolitan Region, the method helps to estimate its population, considering the likely spill over population from other constituent areas such as Panvel, Navi Mumbai, Thane, Kalyan-Dombivali, Ulhasnagar etc, and likely potential of NAINA and KNT-to absorb the shifts. The conventional methods of trend projection (arithmetic, geometric) etc, are not suitable for NAINA (and its part areas) as the population growth is likely to occur on the account of new economic inputs like NMIA, expansion of JNPT, an emerging rail link at Panvel, and warehousing activities at Kalamboli, expanding housing market of Mumbai/ Navi Mumbai aided by infrastructure provision by CIDCO. Therefore, Shift and Share method has been used to estimate the population of NAINA & KNT for the horizon year 2034.

Similar method was adopted for MMR Regional Plan 1996-2011 as well. This is essentially a step down or "from whole to part" approach. Since NAINA and KNT are integral parts of MMR, the method helps to estimate its population, considering the likely spill over population from other constituent areas such Navi Mumbai, Panvel, Thane, Kalyan-Dombivali, Ulhasnagar etc, and likely potential of NAINA and KNT to absorb the shifts. Three scenarios have been worked out such as Low, Medium and High for estimating population. Accordingly, the estimated population of NAINA & KNT would range from 22 lakhs to 29 lakhs by the year 2034. The estimated population of NAINA & KNT is presented in Table 3-1 below.

Table 3-1: Estimated Population of NAINA & KNT in Low Growth Scenario (in Lakhs)

| <u>Jurisdiction</u> | Population 2011 | Estimated Base Year | Base Year Estimated Population | | |
|---------------------|-----------------|---------------------|--------------------------------|-----------------|-----------------|
| | | Population (2014) | <u>2021</u> | <u>2031</u> | <u>2034</u> |
| NAINA | <u>3.50</u> | <u>3.64</u> | <u>5.9</u> | <u>13.0</u> | <u>17.7</u> |
| KNT | <u>0.54</u> | <u>0.56</u> | 1.2 | 3.3 | <u>5.1</u> |
| Total (NAINA + KNT) | <u>4.04</u> | <u>4.20</u> | 7.1 | 16.3 | 22.8 |

3.1.1 PROPOSED CITIES AND POPULATION DISTRIBUTIONDISPOSITION OF CITIES

The estimated population is likely to concentrate in the proximity to three major economic inputs viz Taloja Industrial Area, NMIA at Panvel, an emerging rail link at Panvel and warehousing activities at Kalamboli and JNPT.

Considering a number of factors such as contiguity to Navi Mumbai, connectivity, availability of developable lands, physical environmental constraints, intention of developing compact cities and so forth, the future structure of urban form in NAINA and KNT has been envisaged to be encouraged at three cities in a cluster/compact manner. Following are the two cities proposed in NAINA and Khopta as a distinct city. Accordingly, projected population of NAINA has been distributed into proposed cities, and Khopta as standalone.

Central NAINA (Phase IA + IB)

— Northern NAINA (Thane 14 Villages)

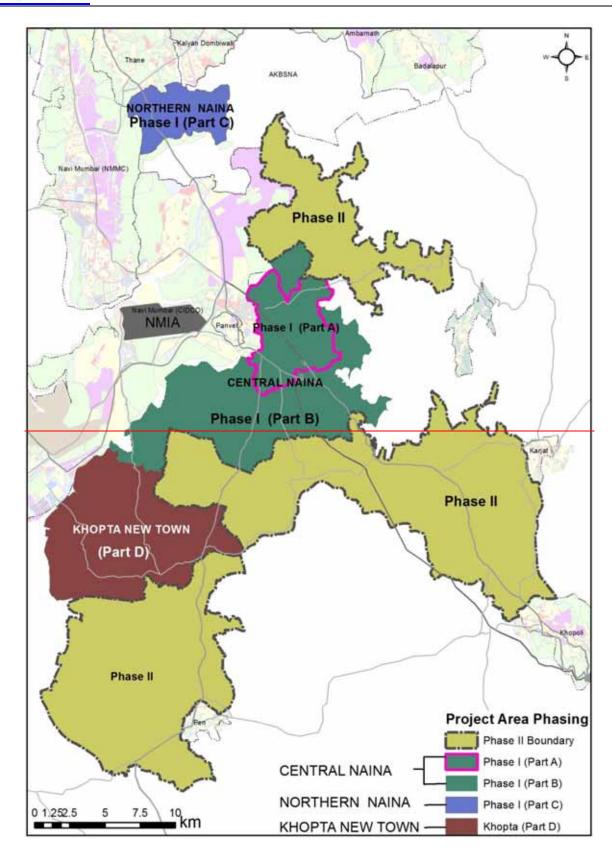

Table 3-6: Population distribution among proposed cities within Project Area (in Lakhs)

| Program I City | 2011 Daniel d'an | Estimated Base Year | Estima | nated Population | | |
|----------------------------|------------------|---------------------|-----------------|------------------|-----------------|--|
| Proposed City | 2011 Population | Population (2014) | 2021 | 2031 | 2034 | |
| Central NAINA | <u>1.0</u> | <u>1.1</u> | 2.7 | 9.5 | 12.7 | |
| Northern NAINA | <u>0.2</u> | <u>0.2</u> | 0.5 | 1.7 | 2.1 | |
| Rest of NAINA ¹ | <u>2.3</u> | <u>2.4</u> | 2.6 | 2.9 | 3.1 | |
| NAINA Total | <u>3.5</u> | 3.6 | 5.8 | 14.1 | 17.9 | |

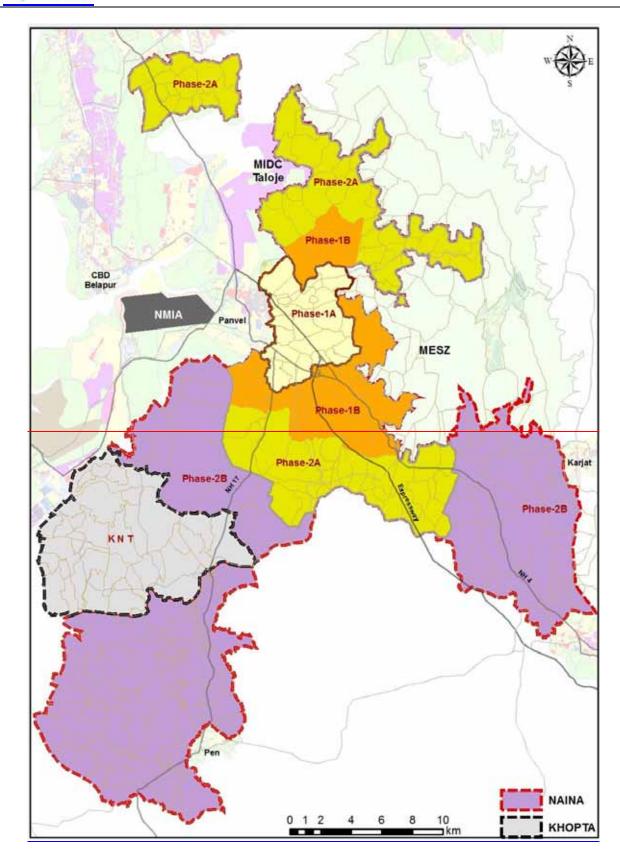

Source: Census of India 2011, and Estimated beyond 2011

¹ Areas other than central & northern cities of NAINA, are assumed to be growing at little lower side as they were growing historically. These areas will essentially be growing at lesser densities in comparison with proposed cities.

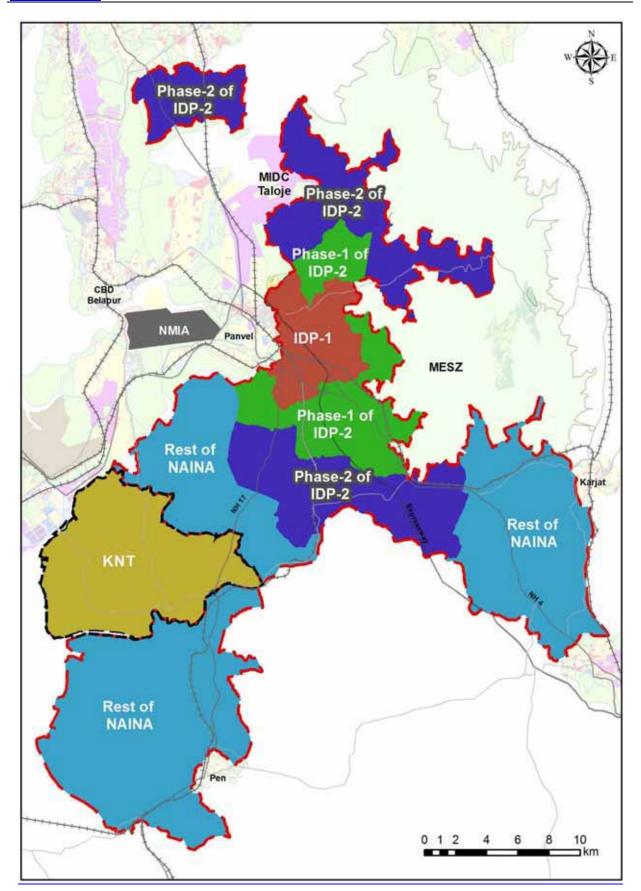

Figure 3-1: Map showing Phasing of NAINA & KNT and location of IDP

These concentrations are considered as cities and their estimated populations are given in Table 3-2 below.

- 1. Central NAINA Phase I (Part A+B)
- 2. Northern NAINA Phase I (Part C)
- 3. Khopta New Town Phase I (Part D)

| Phase I + Phase II | Total | <mark>4.1</mark> | 4.4 | 6.5 | 16.6 | 22.5 |

Source: Census of India 2011, and Estimated beyond 2011

3.1.23.2.2ESTIMATED POPULATION FOR OF IDP AREA

IDP area is an integral part of NAINA. Present population of 23 villages is about 0.65 lakh as per 2011 census. IDP area is expected to be fast growing area in NAINA compared to the other areas. Given this context, population was estimated for this area considering various parameters like land available for development, net plot area, percapita amenity space requirement, percapita built-up area requirement etc. The estimated population of IDP-1 is about 6.2 lakhs (including existing population) by the horizon year 2034. A table describing calculations of population estimated for IDP Area is given in Annexure 3-1.

Further planning of this area in terms of social facilities, physical infrastructure etc. has been done based on population given in below Table 3-2.

Table 3-2: —Estimated Population of IDP Area (in Lakhs)

| Phasing | Population 2011 | Estimated Base Year | Estimated Population | | | |
|----------------|-----------------|----------------------------|-----------------------------|-------------|-------------|--|
| | | Population (2014) | <u>2021</u> | <u>2031</u> | <u>2034</u> | |
| IDP -1-Area | <u>0.65</u> | <u>0.68</u> | <u>1.5</u> | <u>4.6</u> | <u>6.2</u> | |

Source: Census of India 2011, and Estimated beyond 2011

The present IDP area is an integral part of one such city namely Central NAINA. Present population of 23 villages is about 0.65 lakh as per 2011 census. The IDP area is expected to be fast growing area in NAINA as this area is located in Phase I (Part A) among the other areas. The estimated population of Central NAINA is 10.7 lakh by the horizon year 2034. Of which, IDP area population is estimated to be 6.2 lakh. Estimated population of Central NAINA is given in Table 3-3.

Table 3-3: Distributed Population of Central NAINA (in Lakhs)

| | Dhasing | Population 2011 | Estimated Base Year | Estimated Base Year Estimated Popular | | | |
|---|-----------------------|-------------------|---------------------|---------------------------------------|-----------------|------------------|--|
| | Phasing | Fopulation 2011 | Population (2014) | 2021 | 2031 | 203 4 | |
| l | Phase IA (Part A) IDP | 0.60.7 | 0.70.7 | 1.1 | 4.3 | 6.2 | |

| Area | | | | | |
|-------------------|--------------------------|-----|--------------------------|--------------------------|----------------------------|
| Phase IB (Part B) | 0.4 | 0.4 | 0.8<u>1.6</u> | 3.2<u>5.2</u> | 4.5 <u>6.5</u> |
| Total | 1.0<u>1.1</u> | 1.1 | 1.9<u>2.7</u> | 7.5<u>9.5</u> | 10.7<u>12.7</u> |

Source: Census of India 2011, and Estimated beyond 2011

Further, estimated population of IDP has been verified against physical availability of land, using several parameters such as net land available for development, per capita area required for amenities/utilities, per capita built-up area required for living, and FSI. Estimated population coming up based on these calculations is more or less similar to what is arrived out of shift and share method. Table 3-4 explains how population has been verified with the population arrived by Shift and Share method.

Table 3-4: Estimated Population for IDP Area in NAINA

| Sl.No | • | Description | Details |
|-------|----------------------|---|--|
| A | Population (2011) | Population of 23 villages | 65,063 |
| | | Net Plot Area (sq.m) | 14,489,974 |
| | Estimated Population | Per Capita area required for Amenities (sq.m) | 6.25 |
| | | Per Capita built up area requirement (sq.m) | 20.0 |
| ₽ | | FSI | 1.00 |
| | (2034) | Formula for Population Estimation | $\frac{NP = P' \times PCPP + ((P' \times BUA)/FSI)}{BUA)/FSI}$ |
| | | Estimated Population by 2034 | 551,999 |
| | Total (A+B) | Estimated + Existing Population | 617,062 |
| | | Rounded of Population Figure | 6.2 Lakhs |

Source: Census of India 2011, and Estimated beyond 2011

Note:

NP - Net Plot Area
P' - Population

PCPP - Per Capita Amenity Space Required Per Person (Per capita space required for all amenities, utilities & open spaces has been calculated based on the CIDCO Norms)

BUA - Built-up Area Required Per Person (Dwelling Unit Size assumed for EWS is 40 sq.m, and 90 sq.m for others)

FSI - Floor Space Index (Arrived based on the assumption that, 80% of area with 1.2 FSI will be occupied by Land Assembly Model and 20% with 0.6 FSI by Individual developments)

Further planning has been done based on 6.2 lakhs estimated population.

4. REQUIREMENT OF PUBLIC PURPOSES

4.1 PLANNING NORMS

Spatial norms for provision of infrastructure have been laid down by Government of Maharashtra through Government Resolution in 1979, by UDPFI guidelines in 1996 and draft revised ion in 2014 (final version of URDPFI Guidelines). In addition, CIDCO has also adopted a set of norms for planning in Navi Mumbai. A comparative statement of these norms and standards is given in Annexure 4-1. For estimation of social amenities and public utilities, it is proposed to adopt mix of the CIDCO's Navi Mumbai norms, & URDPFI Guidelines & 1979 GR norms of Maharashtra and Waluj Nagar Project Draft Development Plan. Where CIDCO norms are not available, other standards have been considered. Requirement of such social facilities by for the horizon year 2034 is given in Table 4-1 Table 4-1.

Table 4-1: Estimated demand and area requirement for of Social Facilities

| | Facilities | 1 <u>Facility</u> for Population | Area Requirement as per adopted Norms (Ha) | Estimated Demand by 2034 | Area Requirement (Ha) |
|---|--|--|--|--------------------------------|-----------------------------|
| | | <u>(a)</u> | <u>(b)</u> | <u>(c)</u> | (d)=(b)+*(c) |
| A | Educational Facilities | | | | |
| | Balwadi/ Creche | 12,000 | 0.05 | 52 | 2.6 |

4.2 ESTIMATED REQUIREMENT

This section presents estimated demand for proposed social infrastructure facilities such as educational, health facilities, open spaces and other amenities. It includes estimated demand and its area requirement for the facilities required by the horizon year 2034.

CIDCO Navi Mumbai norms have been adopted to project the requirements.

4.2.1 EDUCATIONAL FACILITIES

Demand estimation <u>was</u> carried out for educational facilities which include balwadi/ Creche, primary & secondary schools, colleges and professional institution/ technical colleges. It is estimated that, by the year 2034, about 61 Schools and 52 balwadies would be needed to cater to the basic educational requirement. Similarly about 05 Colleges and 05 Professional Colleges would be needed by the year 2034. Estimated demand and area requirement for educational facilities is given **Table 4-2**.

Table 4-2: Estimated demand and area requirement of Educational Facilities, 2031

| Grouping of Facilities | Facilities | Estimated Demand | | | Area Requirement (in Ha.) | | |
|------------------------|---|------------------|------|------|---------------------------|------|------|
| Grouping of Facilities | | 2021 | 2031 | 2034 | 2021 | 2031 | 2034 |
| Balwadi/Creche | Balwadi/Creche | 15 | 39 | 52 | 0.8 | 2.0 | 2.6 |
| School | Primary & Secondary School | 17 | 46 | 61 | 6.8 | 18.4 | 24.4 |
| | Colleges | 02 | 04 | 05 | 2.0 | 4.0 | 5.0 |
| Higher Education | Professional Colleges/Technical College | 02 | 04 | 05 | 4.0 | 8.0 | 10.0 |
| Total Area | | | | | | 32.4 | 42.0 |

Note: As per education trend observed in Navi Mumbai, it is suggested to have integrated/ composite schools (from pre-primary to higher secondary).

4.2.2 HEALTH FACILITIES

As far as the health infrastructure is concerned, 07 general hospitals and 03 super speciality hospitals would be needed to cater the needs of population by the year 2034. Two general hospitals with an area of 2.5 ha each has been proposed as against 07 to consolidate the total land. This would facilitate the city level medical needs at two significant locations. The Estimated demand of health facilities and area requirement is given in **Table 4-3**.

Table 4-3: Estimated demand and area requirement of Health Facilities, 2034

| Grouping of Facilities | Facilities | Est | imated Dema | and | Area Requirement (in Ha+) | | |
|------------------------|------------|------|-------------|------|---------------------------|------|------|
| | racilities | 2021 | 2031 | 2034 | 2021 | 2031 | 2034 |

| | 1 | 5.1 | 12.2 | 17.0 | | | |
|-------------------|-----------------------------|-----|------|------|-----|-----|-----|
| Health Facilities | Super Specialty Hospital | 01 | 02 | 03 | 2.0 | 4.0 | 6.0 |
| | General Hospital | 02 | 05 | 07 | 1.0 | 2.5 | 3.5 |
| | Dispensary/PHC | 07 | 19 | 25 | 1.1 | 2.9 | 3.8 |
| | Clinics | 17 | 46 | 62 | 1.0 | 2.8 | 3.7 |

4.2.3 SOCIAL AND CULTURAL FACILITIES

The social and cultural facilities, includes religious facilities, community halls, working women hostels, daily bazaar/Market complexes. As per the adopted norms, 62 daily bazar complexes would be needed. Requirement of all social and cultural facilities is given in **Table 4-4**.

Table 4-4: Estimated demand and area requirement of Social and Cultural Facilities

| Cycuming of Easilities | Facilities | Esti | Estimated Demand | | | Area Requirement (in Ha.) | | |
|-------------------------------|----------------------------|------|-------------------------|------|------|---------------------------|------|--|
| Grouping of Facilities | racinues | 2021 | 2031 | 2034 | 2021 | 2031 | 2034 | |
| | Library | 17 | 46 | 62 | 0.9 | 2.3 | 3.1 | |
| Facility Center | Multipurpose Hall | 17 | 46 | 62 | 3.4 | 9.2 | 12.4 | |
| racinty Center | Health Club & Gymnasium | 17 | 46 | 62 | 1.7 | 4.6 | 6.2 | |
| Religious | Religious | 17 | 46 | 62 | 2.6 | 6.9 | 9.3 | |
| Hostel | Working Women hostel | 02 | 05 | 07 | 0.6 | 1.5 | 2.1 | |
| Daily Bazar | Daily Bazar | 17 | 46 | 62 | 1.7 | 4.6 | 6.2 | |
| Community center | Community center | 02 | 05 | 07 | 0.4 | 1.0 | 1.4 | |
| | Total | | | | 11.2 | 30.1 | 40.7 | |

Social amenities and public utilities can be distributed among the authority involved in development (Special Planning Authority) and developments can come up through private developer by way of obtaining development permissions as explained in Development Control Regulations. Some city level or larger scale facilities which are mandatorily to be provided have been shown in IDP. Facilities which are kept 50% expected by developers through NAINA Schemes for private development are not shown in IDP.

4.2.4 PUBLIC UTILITIES

Requirement of public utilities has been worked out. The utility includes fire stations/ police stations and burial grounds. 07 Police Post/Chowky, 04 Fire stations etc would also be needed. Requirement of all utilities is given in Table 4-5 Table 4-5.

Table 4-5: Estimated demand and area requirement of public utilities, 2034

| Grouping of | Facilities | Estimated Demand | | | Area Requirement (in Ha.) | | |
|----------------------------|----------------------------------|-------------------------|------|------|---------------------------|------|------|
| Facilities | Facilities | 2021 | 2031 | 2034 | 2021 | 2031 | 2034 |
| Police & Fire Station | Police Station | 02 | 05 | 07 | 2.0 | 5.0 | 7.0 |
| | Fire Brigade and Allied services | 01 | 03 | 04 | 1.0 | 3.0 | 4.0 |
| Burial/Cremation Ground | Burial/Cremation Ground | 01 | 01 | 02 | 4.0 | 4.0 | 8.0 |
| | Total | | | | 7.0 | 12.0 | 19.0 |

4.2.5 PARKS AND PLAY GROUNDS

Parks and play grounds are essential facilities. It is estimated that, 62 neighbourhood parks and 02 city level parks will be needed for the area taken up to cater to the requirements of horizon year population. (Refer **Table 4-6**).

Table 4-6: Estimated demand and area requirement of parks and play grounds, 2014

| Grouping of Facilities | Facilities | Estimated Demand | | | Area Requirement (in Ha;) | | |
|------------------------|------------------------|------------------|------|------|---------------------------|-------|-----------------------|
| | racinties 20 | 2021 | 2031 | 2034 | 2021 | 2031 | 2034 |
| Parks/ Play Grounds | School Play ground | 17 | 46 | 61 | 10.2 | 27.6 | 36.6 |
| | Parks/ Play Grounds | 17 | 46 | 62 | 51.0 | 138.0 | 186.0 |
| | City level Park | 01 | 01 | 02 | 50.0 | 50.0 | 60 100.0 |
| | Total | | | | 101.0 | 188.0 | 246 322.06 |

DISTRIBUTION OF SOCIAL INFRASTRUCTURE 4.3 DISTRIBUTION OF SOCIAL INFRASTRUCTURE

It is important to mention that, distribution of above estimated facilities facilities would defer due to developments of layouts and facilities coming up in among the NAINA through Layouts/NAINA scheme etc, will have to be differentiated. Based on the above categorization the estimated amenities for year 2034 have been distributed in three groups given in the table below

Group I 100% reservations in IDP: The major and significant amenities such as city parks, crematorium/burial grounds, police station, fire station, general hospital are under these mandatory amenities. Most of these are financially unviable financially unviable or not doable and hence are not likely to be developed through open market.

Group II 50% reservations in IDP and 50% through NAINA Scheme: Certain amenities can get developed through open market as these are commercially viable. Yet 50% of such amenities are shows as reservations in IDP to be developed by CIDCO. This is more of a fall-back arrangement, where if only very few or in the worst case scenario no NAINA Scheme is developed at least 50% amenities will get developed through the reservations. The provision of 50% amenities through NAINA Scheme is governed through the DCPRs. Regulation 13.4.5 stipulates that:

"At least 5% of the land shall be developed as amenity space. Such space shall be used for education and healthcare facilities on priority as given in Table 13.2. Surplus area can be used for other amenity space as guided by SPA NAINA at the time of grant of approval. In case of a school, the layout open space provided will be permitted for use of school and no additional open space for the school playground will be insisted upon for schemes up to 40 ha. The amenities shall be developed and maintained by the developer".

Mandatory amenities in NAINA Schemes: These are mandatory amenities for the developer to provide. In the subsequent discussion it is examined whether 5% provision of layout amenity specified in Regulation 13.4.5 of the DCPRs is adequate to cater for these requirements.

Group III Optional amenities in NAINA Schemes: This is an indicative list and in most cases of large development, a developer would provide these facilities as marketing strategy for the project.

(Further details of NAINA scheme is given in chapter 8 of this report). Abbreviations as well as colour code used while spatially locating required social infrastructure facilities and list of reservations is given in

Annexure 4-2 & 4-3. Following Table 4-7 is self-explanatory in terms of spatial distribution of social facilities

| <u>Table 4-7: Amenities & Utilities shown in Interim Development Plan</u> | | | | |
|---|--|---|---|---|
| Group | <u>Distribution</u> | Social Amenities | Public Utilities | Parks and Play Grounds |
| Group I | 100% designated in IDP | Dispensary/Primary Health Centre General Hospital Community Centre | Police station Fire station Burial Ground | Parks and play grounds City Level Park |
| Group II | 50% designated in IDP | Daily BazaarSchoolsCollege | | • School play grounds |
| Group III | 50% expected by developers through NAINA Schemes | Daily BazaarSchools | | • School play grounds |
| | Other mandatory Amenities to come from NAINA schemes | | | • Open space requirement as Described in DCRs |
| | Optional Amenities in NAINA Schemes | Clinics Balwadi/ Creche Religious Health Club & Gymnasium | | |

All identified social facilities have been bifurcated across various levels. Some facilities cater to the needs of city level and some cater to the needs of peripheral & sector level. Accordingly, facility distribution has been worked out. The same is given in Table 4-8 Table 4-8 below.

Table 4-8: Bifurcation of Social Amenities across City/ Peripheral/ Sector Level

5. PROPOSED TRANSPORTATION _NETWORK—_PLAN

5.1 PROPOSED TRANSPORTATION NETWORK

Transportation network for IDP cannot be developed in isolation. A broad transport network is therefore developed for entire NAINA & KNT as a part of Structure Plan. This has taken into account recommendations of Comprehensive Transport Study (CTS) for MMR. The transportation network for the IDP area is further developed in the context of Structure Plan. There are a number of public transport and road corridors proposed in the CTS, which can provide regional connectivity in NAINA and KNT with respect to rest of the MMR. Necessary realignments of proposals given in the CTS are recommended in the light of proposed Structure Plan for NAINA and KNT.

It is imperative to mention that the proposed transportation plan has been developed to guide the future development of the whole of NAINA—& KNT.— However, the same shall be amended based on site condition while preparing the DP. Annexure 5-1 presents the Proposed Transportation Plan for Project Area (NAINA & KNT together)

The proposed network is described in the following sections:

- CTS Proposals for NAINA and KNT;
- Mumbai-Vadodara Sspur (Proposed by NHAI)
- Additional Urban Transport Network in NAINA and KNT-to improve transit and road access in the light of proposed Structure Plan;
- RoWs Treatment of important Public Transport <u>Corridors</u> and Road Corridors.

5.1.1 CTS RECOMMENDED PROPOSALS IN NAINA AND KNT

As stated above, recommended public transport and road corridors of the CTS, which pass through the Project Area (NAINA & KNT together)together), are important to provide regional connectivity in Project Area with respect to rest of MMR. Key proposals, which shall influence urban structure of Project Area and specifically to the IDP area are as follows:-

MMC: The proposed MMC is an important corridor, which connects various parts of the Project Area right from north end to south end. The MMC is a multimodal corridor, which will provide public transport and road based connectivity to important parts of MMR between Vasai Road/Virar to Uran and further to Alibaug. As part of the Structure Plan for Project Area, MMC is proposed for realignment in the northern parts of the Project Area to enable its efficient use with respect to proposed development. Service roads will be provided along the MMC on both sides to provide local access for the proposed development. The RoW proposed for the MMC is approximately 100m to accommodate metro, regional road traffic, and service roads on both

sides. Approximately 11–8.4 km of length of MMC from the North of Village Akurli up to Village Belavali in the South passes through the IDP area.

- Mumbai Vadodara Sspur: The proposed Sspur Highway proposed by NHAI from Virar to JNPT, which is passing through project area in general and IDP area in particular. This highway was proposed by NHAI to mainly connects JNPT. Mumbai Vadodara Sspur has been integrated with MMC to avoid passing of two 100m wide roads bifurcating the IDP area. Mumbai Vadodara Sspur will join MMC and instead of 100m ROW for each road the width of the MMC will be increased to 126 m.- This increased width will accommodate the carriage way of Mumbai Vadodara Sspur. In this way instead of two 100m roads one 126 m road is proposed saving valuable land.
- Metro Network: There is an extensive network proposed for metro to connect Navi Mumbai and other sub-urban towns to main economic centres in Greater Mumbai. The proposed metro network in the adjoining areas of NAINA and KNT is aimed at connecting CBD of Belapur, Kharghar Township, Taloja MIDC Industrial Area, NMIA, JNPT, Uran, Panvel. Some of these important proposed metro corridors with respect to the Project Area are as follows:
 - o Mankhurd-Vashi-Narthengaon (M17)
 - o Vashi-Belapur-NMIA-Panvel (M18)
 - o Targhar-Kharkopar-Nhava Sheva-Dronagiri (M19)
 - Kharkopar-Dhutum-Pirkone-Shirkhi-Vadkal (M20)
 - Dronagiri-Pirkone-Jite (M21)
 - o Shirki-Washi-Jite (M22)

Location of above metro corridors is shown in Annexure 5-2.

It is important to mention that CTS was carried out prior to notifications of NAINA and KNT by the Government of Maharashtra., project came into existence Hhence it is desirable that some of the metro corridors are extended and coordinated with the proposed Structure Interim Development Plan for the IDP area.

It is recommended that metro link proposed up to Panvel is extended into the IDP Area near Panvel, which can culminate with MMC to enable Transit Oriented Development (TOD).

- Sub-Urban Rail Network: Following two proposed sub-urban rail corridors passing through the IDP Area.
 - o Panvel-Karjat Sub-urban Corridor (S4); and
 - o Panyel-Rasayani Sub-Urban Corridor along Konkan Railway (Panyel-Jite-Thal: S2).

It is important and desirable to implement on short-term needs, Panvel-Karjat Sub-urban rail corridor to facilitate development within the IDP Area.

• Freeway and Arterial Road Network: A number of freeways and arterial roads linking the IDP area are already proposed in CTS, which is of regional importance and an important part to

extend quality road connectivity in the Project Area. These roads hence needs to be realized on short to medium term basis.

• Other Important Links relevant to the IDP Area: Among the other proposals in CTS and other studies, the important transport links of the IDP Area are Mumbai Trans Harbour Link (MTHL), Mumbai-Vadodara Spurspur, and NMIA. These transport nodes and links will trigger to advance the development within the IDP area.

5.1.2 ADDITIONAL <u>PROPOSED</u> URBAN TRANSPORT NETWORK WITHIN THE IDP AREA

To further expand public transport and road network in the Project IDP Area with respect to CTS proposals following strategies and network are adopted.

- To merge Redesign the MMC & MV Sspur. Right of Way prescribed for combined corridor in IDP area is 126m. The combined corridor will have 4+4 lanes of MMC & Sspur carriageway either side. Further, this corridor will have service lanes on either on either side eross section to suit connectivity needs of the IDP Area. It is proposed to provide service corridors along the MMC on both sides to adequately meet local traffic demand. Typical cross-section of the MMC is given in subsequent sections.
- A spine all-road is proposed to meet Project Area's IDP area traffic needs. A RoW is proposed to be reserved for long-term needs for a spineal road, which will connect MMC and NH-4 to eastern end of the Project Area IDP along Mumbai-Pune Expressway. A RoW of 60-m is proposed for the spineal road. Its Cross section in given in the following section.
- Hierarchical Road Network: A hierarchical road network is proposed to provide access into various parts of the Project AreaIDP area with road network having RoWs for Sub-Arterials as 60m and 45m, sector roads and local access roads as 35m and 27m and & 20m respectively.
- It is proposed that for Phase I development, existing road network comprising Mumbai-Pune Expressway, NH-4 and SH-54 (Panvel-Matheran), be utilized to provide transport access in to the IDP Area. Necessary modification and entry points are proposed in order to facilitate Phase 1 development.

5.1.3 PROPOSED ROWS FOR TRANSPORT AND ROAD CORRIDORS

A hierarchical road network is proposed to provide access into various parts of the IDP area with road network having RoWs for Sub-Arterials/ City level as 60 and 45m, Peripheral roads as 35m and 27m, and sSector roads/-and-local access roads as 35 m, 27m and 20m respectively. Approximately, 86 km of road network proposed in IDP area. Proposed transport network is shown in Figure 5-1. Typical cross sections of all transport corridors are given in Annexure 5-3.

Table 5-1: Length of Proposed Roads with RoW in IDP Area

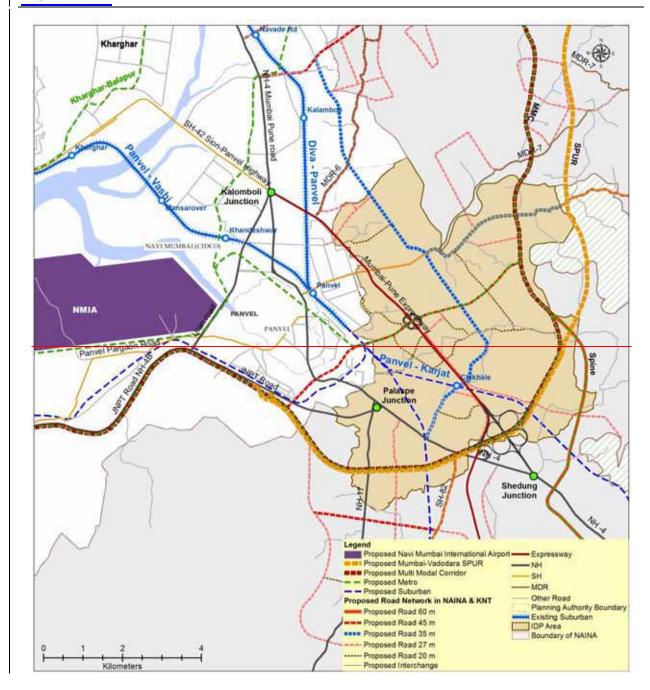

| | <u>Sl.No</u> | Category of Road | Existing/ Proposed for Widening (length in m) | Newly Proposed (length in m) | Total (length in m) |
|---|--------------|---|---|------------------------------|------------------------|
| | <u>1</u> | $\underline{MMC} + \underline{S}spur (126 \text{ m RoW})$ | Ξ. | <u>8,417</u> | <u>8,417</u> |

5.1.4 METRO LINK EXTENSION TO IDP AREA

A metro link connecting Panvel to IDP (from west to east) area has been proposed to connect proposed MMC. Metro corridor proposed on 45m wide proposed IDP road. Approximate length of this metro corridor is xxx4.5 km. Proposed proposed metro link is shown in Figure 5-2 Figure 5-2.

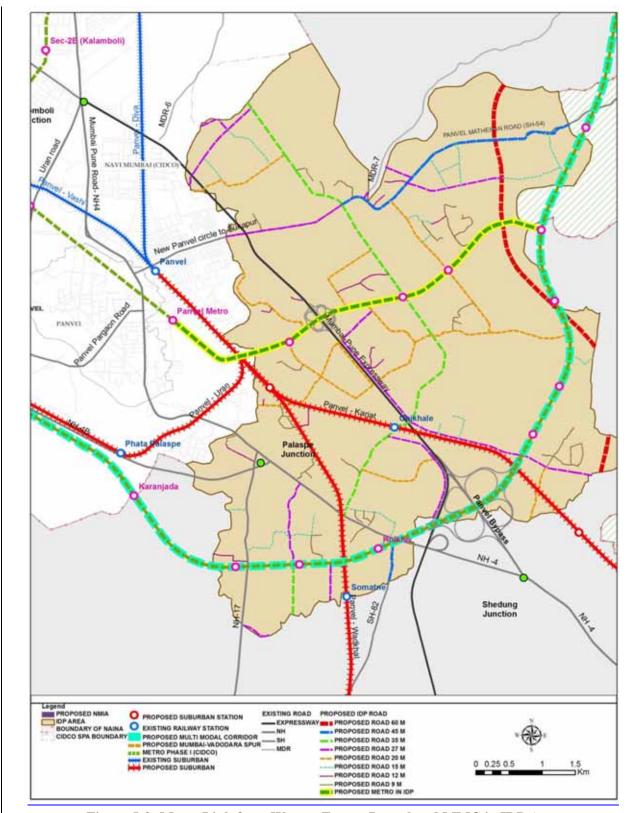

Figure 5-2: Metro Link from West to East to Panvel and MMC in IDP Area

6. PROPOSED LAND USE

6.1 KEY CONSIDERATIONS OF THE PLAN

The structure of the proposed land use for IDP Area is evolved around following considerations.

6.1.1 PROPOSED ENTRY/EXIT POINTS TO THE IDP AREA

To enhance the better accessibility from the existing and the proposed road network, the Plan proposes seven entry/exit locations to the IDP area. They are very much essential in terms of local and regional connectivity. The locations of entry/ exit points to the IDP Area are follows (Refer Figure 6-1).

- Mumbai-Pune Expressway near Vichumbe Village;
- 2. NH-4B near Karanjade;
- 3. NH-4 near ONGC Hospital;
- 4. NH-4 near Kon Village;
- 5. Gurudwara Road Panvel;
- 6. MMC; and
- 7. SH-54.

Figure 6-1: Location of Entry/ Exit points to the IDP Area

6.1.2 PROTECTION OF NATURAL AREAS

The IDP Area is partially located in the hilly terrain of

Western Ghats, which has sensitive areas of natural and <u>economic_ecological_importance</u>. Protecting these natural areas is important <u>to-for_regional ecological importance</u> of MMR and Western Ghats.

As part of the protection strategy, the IDP proposes following areas to be protected from urban development. Hills with more than 20% gradient;

- Hills with more than 20% gradient;
- Natural drainage Rivers and Nalas with buffers;
- Protected Forests; and
- Water bodies with buffers.

The above-mentioned areas will be an important ecological layer of the IDP Area and more detailed studies may be promoted to ensure the well-being of natural and environmental values of these areas. These areas may be used for passive recreational activities. Summary of environmental sensitive areas is given in Table 6-1. Location of these features is shown in Annexure 6-1.

Table 6-1: Summary of Environmentally Sensitive Areas in IDP Area

| Sl.No. | Land Use | Area (in Ha) | % of total IDP area |
|--------|-----------------------------------|-----------------------------|-----------------------------|
| 1 | Forests | 230 222.00 | <u>496.2</u> |
| 2 | Water bodies | 8 6.9 2 | <u>18.12.4</u> |
| 3 | Steep hill slopes (20% and above) | 14 <u>9</u> 8.96 | <u>32.94.0</u> |
| | Total | 465.9 453 | <u>100</u> 12.65 |

Source: Areas calculated from available existing land use 2014e

6.1.3 LEVERAGING EXISTING AND PROPOSED ECONOMIC NODES IN AND AROUND THE IDP AREA

The IDP Area is located in proximity to important existing and proposed economic nodes. Leveraging these economic nodes to provide support economic and social infrastructure is important to bring success to the development of IDP Area. These major economic nodes are as follows:

- Upcoming NMIA at Panvel;
- An emerging rail link at Panvel-and
- Warehousing -activities at Kalamboli;
- CBD, Navi Mumbai; and
- Taloja Industrial Area
- Expanding housing market of Mumbai/ Navi Mumbai-

Provision of efficient transport network particular public transport and high quality infrastructure would help IDP to capture the growth impulses of these economic opportunities.

6.1.4 TRANSIT ORIENTED DEVELOPMENT (TOD)

Transit Oriented Development is an integrated approach of transport and land use planning leading to compact, high density developments located around public transit nodes such as metro stations, railway stations or multimodal transit hubs. The development has a rich mix of land uses including commercial, residential, and institutional; designed to maximize the access to transit and non-motorized transport. The term transit includes variety of modes including Metro rail, suburban rail, light rail, road based public transport etc. and a mix of all these gives rise to a variety of land use patterns around the transit corridors and nodes. The proposed growth centres are located along the transit route in the form of TOD.

CTS carved out a vision for MMR's future transportation as a seamless, integrated system for safe and convenient commuter travel throughout the region with a strong emphasis on public transport. In order to support the anticipated economic development in MMR and subsequent inter-related transport challenges given by population and employment growth, 'Transit First' was considered as a guiding principle in preparation of the transport plan for MMR.

With this vision, the CTS identified major Transport Networks for MMR to serve multiple growth centres identified within the region. Other important aspects of the Plan are capacity enhancement of existing suburban and metro corridors, connecting major existing and planned activity centres of the region providing exclusive bus lanes to reinforce rail-based transit with a higher order road based public transport systems.

During the CTS Study, NAINA was not envisaged as a region of intensive urban development. Therefore, in light of delineation of NAINA as a separate region under influence of NMIA and new urban development strategies being devised for the region, calls for augmenting the transit network proposed under CTS.

Based on Mumbai and Navi Mumbai experience and also other international regional planning practices, economic growth of the region is maximized by effective public transit connectivity. Given that the major economic drivers of the IDP area including NMIA, JNPT and Industries (Taloja MIDC, Kalamboli) actually lie outside the region, it is very critical to integrate these economic and employment centres with the region through public transport.

Thus, promoting TOD is the key aspect of the transport and land use plan of the Project Area as a whole and the IDP Area in particular.

6.1.5 INTEGRATION OF GAOTHANS & EXPANSION AREAS

The Gaothans are developed and the expansion areas are developing rapidly. To achieve planned urban development integration of Gaothans and their expansion area is necessary. Road network, and social and physical infrastructure is provided for the same.

Such same same. —Such a strategy would enable integration of the village settlements to the urban structure of the IDP Area, hence leading to a healthy planned urban development.

6.2 LOCATION OF GROWTH CENTRES

- The 15 % land reserved for growth centre, development charges and OCSDC shall be the main sources of revenue for funding City & Peripheral level infrastructure.
- The FSI permissible on growth centre lands shall be 1.7, at par with the FSI potential of the participants in 'NAINA scheme'.
- The Growth centre shall not be used for EWS/LIG housing or development of Social facilities.
- The Growth centre land shall not be allotted for any request of land by Govt./Semi-Govt. Agency at concessional prices.
- In Growth Centre component, no amenity space needs to be provided.
- Only internal and layout roads and open spaces will be required to be provided without losing FSI potential.

6.36.2 BROAD AND FLEXIBLE ZONING

Though concept of zoning is important, rigid land use zoning concepts are gradually becoming an obsolete idea in urban planning and in the context of role of <u>promoting</u> private developers in <u>Mumbaiurban development</u>. Hence, it is desirable to promote the concept of zoning with flexibility to promote compatible land uses in various zones. Idea is to promote flexible zoning, especially when the SPA intends to promote common infrastructure and urban development in the IDP Area with major role from developers and other real estate entrepreneurs.

6.3.16.2.1 FLEXIBLE ZONING

As suggested in Structure Plan document of NAINA & KNT, The concept of flexible zoning is evolved for land use plan of the IDP Area. In each zone compatible land uses are defined under preferred, permitted, and prohibited uses. The concept of flexible zoning is to encourage enabling of flexible environment for private sector led development and to tap market demand with changing economic scenario.

As a part of overall land use structure of the Project Area (NAINA and KNT), the <u>IDP</u> area is delineated into nine <u>5five</u> zones which are N1 to <u>N7N5</u>, <u>LDZ</u> (<u>Limited Development Zone</u>) and <u>DDZ</u> (<u>Deffered Development Zone</u>). The developable area of 2463 ha, as indicated in Table 2.3 is divided into following land use zones. Further description of proposed land use zones is given below;

N1: Predominantly Residential: The zone is aimed at promoting residential townships and support social infrastructure. Compatible functions to that of residential development would be permitted in N1.

N2: Growth Centre Zone: The Zone will be developed by SPA-NAINA and will have predominantly commercial, business, residential activities

N2: Growth Centre: The zone is aimed to promote commercial and business activities.

N3: Mixed Use Zone: The zone is aimed to promote mixed use activities, which can be located along areas of higher accessibility where land uses and activities related to public and economic importance can be located.

N4: Urban Village: Initially, 200m buffer from revenue gaothans was identified in MMR Regional Plan 1996-2011. The same concept has been taken forward and demarcated on plans. These areas are termed as The zone around 200m of existing inhabitated gaothans as shown on the planUrban Villages.

As per the sanctioned Regional Plan of MMR 1969 to 2011 and MLRC (Maharashtra Land Revenue Code)

N5: Recreational Zone: The zone is aimed to promote open spaces and recreational activities and lung spaces.

The permissible use in each zone are use in each zone is classified as permissible, permitted permissible with conditions as specified and prohibited.

The conditions are as follows

No.

Details

| <u>1</u> | Should abut IDP road minimum 20 m wide or layout road minimum 15 m wide |
|-----------|---|
| <u>1A</u> | Should abut IDP Road minimum 15 m wide or layout road of 9 m |
| <u>2</u> | Independent Building/If mixed use in same building then separate access |
| <u>3</u> | Only manufacturing of bricks, earthen pots, country tiles etc. |
| <u>4</u> | i) Should not be located within the distance of 90 m. from any junction of roads having min. |
| | width 12 m. each from nearest gate of a school, hospital, theatre, place of assembly or stadium. |
| | ii) Restrictions imposed by Ribbon Development Rules, IRC, MoRTH shall apply. |
| | iii) Petrol filling station shall not be sited on the convex side of a road curve. In case the curve is |
| | not very sharp and cars moving out of the station are completely visible to the traffic from a |
| | distance of at least 90 m. and vice versa, a petrol station may be permitted on such a convex |
| | eurve. |
| <u>5</u> | Should be at a distance of minimum 60 m from educational and hospital buildings |
| (| Plot size shall not be less than 5 ha; permanent built up facilities shall not cover more than 10% of |
| <u>⊕</u> | the gross land area. |

General Conditions for all development

i)In case of plots fronting on National Highway, State Highway and Major District Roads, the building line shall be as per Ribbon Development Rules shall apply

ii) A stadium shall generally accommodate 400 m. running track.

Existing use as plantation, orchards shall continue irrespective of surrounding land use zone. The FSI will be as per the adjoining zone. Corresponding DR will be permitted to be transferred to the adjoining contiguous land according to TDR Regulation 43; subject to the condition that plantation use will be retained and preserved.

The conditions are as follows:

| No. | Details | | | | | |
|-----|---|--|--|--|--|--|
| 1 | Should abut road of minimum 18 m width | | | | | |
| 2 | Independent Building/If mixed use in same building then separate access | | | | | |
| 3 | Only manufacturing of bricks, earthen pots, country tiles etc. | | | | | |
| 4 | i) Should not be located within the distance of 90 m. from any junction of roads having min. width 12 m. each from nearest gate of a school, hospital, theatre, place of assembly or stadium. | | | | | |
| | ii) Restrictions imposed by Ribbon Development Rules, IRC, MoRTH shall apply. | | | | | |
| | iii) Petrol filling station shall not be sited on the convex side of a road curve. | | i) In case of plots fronting on National Highway, State Highway and Major District Roads, the | | | | | |

building line shall be as per Ribbon Development Rules shall apply

ii) A stadium shall generally accommodate 400 m. running track.

Existing plantation, orehards shall continue as a use irrespective of surrounding land use zone. The FSI will be as per the adjoining zone. The FSI can be loaded on the continuous adjoining land.

6.3.26.2.2 PROPOSED LAND USE

The gross area of IDP is 3683 Ha, out of which the area available for future development able area is 2463 Ha. -Five land use zones along with support reservations have been proposed in IDP. It is important to mention that, N-2 zone which is predominantly Growth Centre Lands earmarked as CIDCO's land bank. Apart from GC, predominantly residential, mixed, urban village and recreational land uses have been proposed in IDP. Flexible Zoning concept has been adopted in IDP. List of activities permissible under these land use zones are given in detail in DCPRs. This developable area includes 25% reservations towards proposed roads (13 %), parks and playgrounds (8 %), amenities and utilities (4%). 15% of the developable area is reserved for growth centres. The social facilities and amenities include burial/cremation grounds, community centre, fire station, police station, college, school, play grounds, daily bazaar, general hospital, and primary health centre. aApart from the land use zones, IDP reservations have been earmarked on IDP Plan. Map showing proposed land use zoning is given in Figure 6-2Figure 6-2.

Open spaces:

The open spaces proposed in the IDP can be categorized as active and passive open spaces.

- a) **The passive open spaces** include forests, river, and water bodies. The passive open spaces work out to be 9.58.32 % of the gross IDP area. These open spaces will serve as lungs spaces for the city and works out to 5.67 sq.mm²- per person (considering 6.2 lakh estimated population).
- b)—The active open spaces in IDP comprise two forms, viz., IDP reservations; and open spaces through layout permissions. The active open spaces reserved in IDP are 5.3% on gross IDP area (i.e. 8% on developable land area), which works out to be 3.15 sq.mm²-, per person (considering 6.2 lakh estimated population). As mentioned in the DCRs, 10% open spaces are required to leave in private developments/ schemes. Thus, open spaces required per person through layouts works out to be 2 sq.mm². each land holding having area more than 0.4 Ha, shall require providing open spaces @ 10%. It is assumed that 80% of the land available with land owners (i.e. 60% of developable land) will be having aggregations more than 0.4 Ha. Thus, 48% of the developable land (80% of 60%) will be having land area more than 0.4 Ha. Therefore, the open spaces through layout permissions of these lands will be 3.14%, which works out to be 1.86 sq.mm²-, per person (considering 6.2 lakh estimated population). Hence,
- e)b)Considering passive and active open spaces, the open space per person of the gross IDP area is about 10 sq.mm².per person.

The proposed land use distribution across the IDP area is given below in

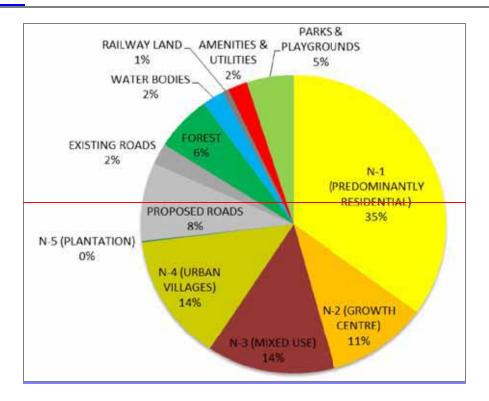

Table 6-2: Area Statement for Proposed Land Use in IDP Area Table 6-2

| Sl.No. | Proposed Land Use | Area (in <u>Ha)</u> | % to IDP Area | % to Developable land of 2463 ha |

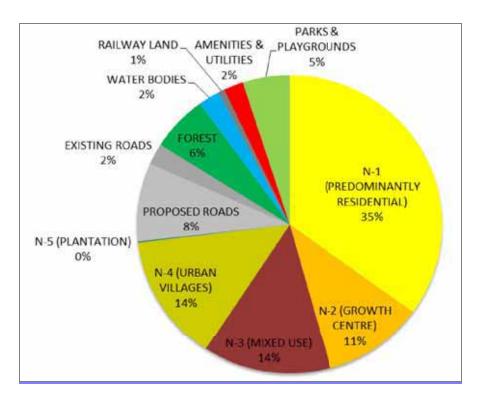

Figure 6-2: Proposed Land Use of IDP Area

25% of Developable land has been demarcated for city level and peripheral level infrastructures such as proposed roads & reservations. 15% developable land has been earmarked against growth centre lands (List of Growth Centres is given in Annexure 6-3) which will be on the account of CIDCO to further

utilize those lands for other purposes. The proposed land use distribution of against developable land available within IDP area area is given in Table 6-232.

6.46.3 **SECTORS**

The IDP area is divided into ten (10) sectors. The division of sectors is based on the existing and proposed physical features such as rivers, railway line, proposed and existing <u>major</u> roads. The sectors were divided considering the geographical area and population. The average area of each sector is 350 Ha. The estimated population of each sector is approximately 60,000. Map showing delineation of sectors is given in Annexure 6-34.

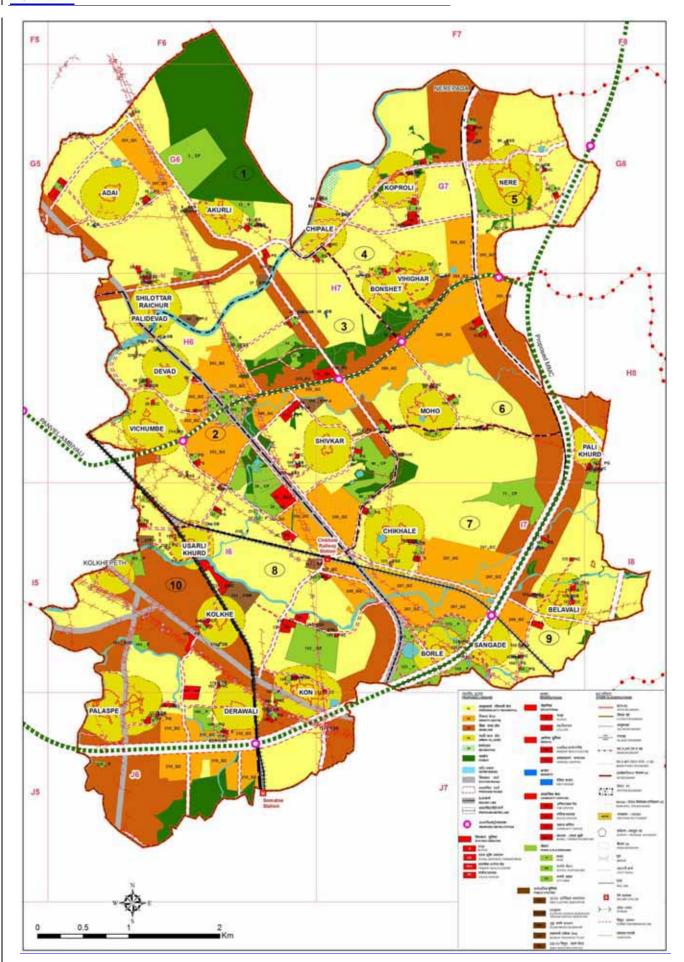

Figure 6-3: Proposed 4Land Use Distribution in IDP Area, 2014-2034

7. PHYSICAL INFRASTRUCTURE

7.1 INTRODUCTION

The physical infrastructure components considered for development of proposed IDP Area have been presented below:

- Water Supply;
- Sewerage and recycling;
- Drainage, and river training;
- Solid Waste Management; and
- Power supply.

7.2 WATER SUPPLY

7.2.1 GROSS WATER DEMAND

Based upon the existing and proposed residential, commercial (employment), horticulture (Urban Greens) (Urban Greens) and fire_fighting demand, the gross water demand for the IDP area has been worked out.

For <u>calculating</u> working out fresh water demand at consumer end, the quantity of recycled water from Tertiary Treatment Plants (TTPs) after subtracting the losses in the supply system has been deducted from the total demand. The For working out, gross water demand has been calculated after adding 28 percent losses in distribution and transmission system has been considered as per norms prescribed by CIDCO for design of water supply system.

Table 7-1: Water Demand for IDP Area

| l | Tuble / 1. Water Demand for 1D1 Area | | | | | | | | |
|----------------------|--------------------------------------|--------------|---------------|----------------|----------------|-----------------|--------------|--------------|-------------|
| Particulars of users | Population / Area in Ha | | | Rate of Supply | 3 | Water De | mand in n | <u>1ld</u> | |
| <u> </u> | <u>2016</u> | 2021 | 2031 | 2034 | <u>in lpcd</u> | <u>2016</u> | <u>2021</u> | 2031 | <u>2034</u> |
| Residential | 90000 | 154000 | <u>462000</u> | 620000 | <u>180</u> | <u>16.20</u> | <u>27.72</u> | <u>83.16</u> | 111.60 |
| Employment | 22500 | 38500 | 115500 | 229400 | <u>45</u> | <u>1.01</u> | <u>1.73</u> | <u>5.20</u> | 10.32 |
| Fire fighting | | 10 | 0*(P/1000) | ^0.5 | | 0.95 | 1.24 | <u>2.15</u> | 2.49 |
| Industries | 116.79 | 116.79 | 116.79 | 116.79 | <u>15000</u> | 1.75 | 1.75 | 1.75 | 1.75 |
| <u>Urban Greens</u> | <u>11.70</u> | <u>78.25</u> | 116.96 | 251.39 | <u>52200</u> | <u>0.61</u> | 4.08 | <u>6.11</u> | 13.12 |
| | | <u>Total</u> | | | | 20.52 | <u>36.53</u> | <u>98.36</u> | 139.29 |

| Recycled Water to be used for Urban greens, fire fighting & flushing | 9.45 | <u>16.17</u> | 48.52 | <u>66.95</u> |
|--|--------------|--------------|--------|---------------|
| Net Fresh Water Demand at consumer end | 11.07 | | 49.85 | <u>72.34</u> |
| Distribution, Treatment & Transmission losses 28% | <u>3.10</u> | | 13.96 | 20.26 |
| Total Demand at source with recycling | <u>14.17</u> | | 63.80 | 92.59 |
| Demand with outwithout recycling | <u>26.27</u> | | 125.91 | <u>178.29</u> |

Based upon above norms the <u>water</u> demand for <u>plan horizon year 2034 for total</u> IDP area works out as 92.63 mld_, and if the recycling is not considered the demand of fresh water shall be as high as 178 mld. The detailed calculations are shown in <u>Table 7-1 above</u>.

Table 7-1: Water Demand for IDP Area

7.2.2 SOURCES OF WATER

It is understood that the CIDCO is presently gets water from Hetawane dam and MJP to meet the water demand of its New Town Development Authority (NTDA) Area i.e Navi mumbai. The availability from these sources is nearly 265 mld. A project named from Balganga project damdam is under execution, which is likely to be completed by 2016. The availability from this source shall be 350 mld. Besides, a new source from proposed Kondhane dam is under consideration. CIDCO is expecting to get 250 mld of water from this source by 2026. CIDCO has worked out year wise demand of its developed/ developable area (other than NAINA) from 2015 to 2030. Based on this data, a statement showing demand, availability and excess has been prepared and shown in Table 7-2 Table 7-2.

Table 7-2: Demand/Availability of Water in CIDCO area

| Year | Demand in mld | Source | Present Status of source | Available Water in mld | Excess in mld | |
|------|------------------|--------------|--|------------------------------|---------------|--|
| | | Hetawane Dam | Existing | 150 | | |
| 2015 | 251 | MJP | Existing | 115 | 14 | |
| | | | Total | 265 | | |
| | | Hetawane Dam | Existing | 150 | | |
| | | MJP | Existing | 115 | | |
| 2016 | 274 | Balganga Dam | Under Execution (likely to be completed by 2016) | y 2016) 350 | 341 | |
| | | Total | | 615 | | |
| | | Hetawane Dam | Existing | 150 | | |
| | | MJP | Existing | 115 | | |
| 2021 | 487 | Ralganga Dam | Under Execution (likely to be completed by 2016) | 350 | 128 | |
| | | | Total | 615 | | |
| | | Hetawane Dam | Existing | 150 | | |
| 2026 | | MJP | Existing | 115 | | |
| | 667 | Balganga Dam | Under Execution (likely to be completed by 2016) | 350 | 198 | |
| | | Kondhane Dam | Under Consideration (expecting to get water by 2026) | 250 | | |

| Year | Demand in mld | Source | Present Status of source | Available Water in mld | Excess in mld |
|------|------------------|--------------|--|------------------------------|---------------|
| | | | Total | 865 | |
| | | Hetawane Dam | Existing | 150 | |
| | | MJP | Existing | 115 | |
| 2030 | 780 | Balganga Dam | Under Execution | 350 | 85 |
| 2000 | ,,,, | Kondhane Dam | Under Consideration (expecting to get water by 2026) | 250 | |
| | | | Total | 865 | |

It is evident that CIDCO will have excess of water with respect to demand of NTDA Area 2016 onwards (if proposed sources are developed as expected). Ultimately, in the year 2030, CIDCO shall be haveing 85 mld of water in excess of NTDA Area's demand. The ultimate demand of IDP Area in the horizon year 2034 is calculated as 93 mld and the demand in 2031 is only 63 mld as shown in Table 7-1 Thus, the demand of IDP Area can well be met from excess water available from CIDCO sources till the year 2033-34. However, for beyond 2034, some other sources will be required to be tapped to meet the demand of 8 mld for IDP area. However, this is subject to maximum utilization of recycled with-water right from the beginning.

7.2.3 PROPOSED SOURCES OF WATER

As per proposals of Balganga Water Supply Scheme (350 mld) of CIDCO, the water drawn from the dam is proposed to be treated at Nidhiwali Water Treatment Plant, from where it shall be pumped to a Break Pressure Tank, and then shall be transferred to Master Balancing Reservoir (MBR) near VAHAL through 2500 mm diameter Pipe line. The detailed note on water supply demand is given in Annexure 7-1. A detailed note showing design norms, standards, demand calculations, estimates etc regarding water supply project is annexed as Annexure-7-1

7.3 7.3. SEWAGE GENERATION, ERAGE COLLECTION, TREATMENT AND RECYCLING SYSTEM

7.3.1 7.3.1 ESTIMATION OF SEWAGE GENERATION

As prescribed in CPHEEO manual, it is assumed that 80% of water actually supplied at consumer end for domestic use and 60% of water supplied to industries shall be generated as Sewage/ waste water. While working out sizes of collection system and capacity of Sewage Treatment Plant, provision has been kept for 20% infiltration through sewer lines. But while calculating the water available for recycling, the infiltration has not been considered, assuming that during summers and winters the infiltration shall—shall be almost be—negligible. Accordingly, the capacity of STPs and Tertiary Treatment Plants (TTPs) required has been worked out and shown in Table 7-3.

Table 7-3: Sewage Generated, Capacity of STPs & TTPs required

| Sewage Generation & Treatment Plants Capacity | <u>2016</u> | <u>2031</u> | <u>2034</u> |
|---|--------------|--------------|---------------|
| Sewage Generation in mld | <u>17.79</u> | 86.08 | <u>118.31</u> |
| Capacity of STPs required | <u>18.00</u> | <u>86.00</u> | <u>119.00</u> |

| Capacity of 1115 Required 12.00 38.00 80.00 | Capacity of TTPs Required | 12.00 | 58.00 | 80.00 |
|---|---------------------------|-------|-------|-------|
|---|---------------------------|-------|-------|-------|

| | Sewage Generation & Treatment Plants Capacity | 2016 | 2031 | 2034 |
|---|---|------------------|------------------|-------------------|
| l | Sewage Generation in mld | 17.23 | 85.01 | 118.86 |
| ĺ | Capacity of STPs required | 17.00 | <u>85.00</u> | 119.00 |
| I | Capacity of TTPs Required | 12.00 | 57.00 | 80.00 |

The recycled water shall primarily be used for proposed urban greens as horticulture requirement and the remaining shall be used in industries mainly for cleaning/washing and in residential areas for flushing gardening, horticultural etc.

7.3.2 7.3.2 PROPOSED SEWERAGE ZONES, COLLECTION SYSTEM AND TREATMENT

Considering the topography of the area, pace of development and land use of IDP, the entire IDP area is divided into 5 Sewerage Zones. The related Tertiary Treatment Plant is also proposed to be installed on the side of STP. The Capacity of STPs and TTPs proposed zone wise is being given in **Table 7-4**Table 7-4.

Table 7-4: Zone wise Capacity of proposed STPs and TTPs in IDP Area

| Sewerage Zone | Capacity of STP | Capacity of TTP |
|-----------------|-----------------|-----------------|
| Sewerage Zone-1 | <u>36.89</u> | <u>24.8</u> |
| Sewerage Zone-2 | <u>19.04</u> | <u>12.8</u> |
| Sewerage Zone-3 | <u>20.23</u> | <u>13.6</u> |
| Sewerage Zone-4 | <u>16.66</u> | <u>11.2</u> |
| Sewerage Zone-5 | <u>26.18</u> | <u>17.6</u> |
| Total Capacity | 119.00 | 80.00 |

The Sewage/Effluent collection system is provided to collect the domestic sewage / industrial waste water from the residential/industrial areas and to convey it to the proposed Sewage Treatment Plant of that zone. Since industrial waste water is very meagre in quantity, thus common collection system is provided for sewage and waste water collection. The zoning and collection network is proposed in such a way that the flow of sewage follows natural slope and conveys the sewage to treatment plant (located at the lowest elevation) under gravity flow.

The Sewage Collection system is being proposed at sector level roads only. The internal sewers including laterals shall be provided by the land developers themselves, which shall further be connected to trunk sewerage system. A detailed note illustrating norms, design, estimates about sewerage system is given in Annexure 7-1.

It is proposed to provide conventional Activated Sludge Process type of Sewage / Treatment Plant. The plant shall comprise Coarse screen chamber, Sewage pumping station, Fine screen chamber, Grit chamber, Oil and Grease traps, Activated sludge type Aeration Chamber with Fluidized Bed Reactor or Moving Bed Biofilm Reactor, Secondary Sedimentation tank, Air Blowers, Sludge pumps, and Sludge drying mechanism.

The Tertiary Treatment Plant (TTP) shall comprise pre-chlorination chamber, rapid gravity sand filters and post chlorination mechanism. The TTPs are designed to receive an inflow of 85% of Sewage generated assuming 15% losses in STP. The losses in TTP are taken as 5%.

7.3.3 7.3.3. OPTIONS FOR SEWAGE TREATMENT AND RECYCLING

The Sewage Collection and recycling system is planned and designed to collect, treat, and recycle all the domestic sewerage and industrial effluent generated from the IDP Area. There are three possible options for collection and treatment of Sewage including Tertiary Treatment and recycling. These are discussed below:

- Sewage and Sullage both are treated by developer of the plot at plot level: This has the disadvantage, that STPs will be located near to the residential areas, secondly, it will not be possible to monitor the quality of treated water as number of STPS will be too large form large number of STPs. On the other hand Sewage from Gaothans and small plots has to be treated at community level STPs, which will again involve infrastructure cost. This also have the problem that how the waste effluent from so many STPs shall be carried to suitable disposal points.
- Sullage is treated at developer level and Sewage is carried to Community level STPs: This will again have the problem of monitoring the quality of treated water being supplied, and <u>further the</u>-sullage from Gaothans / small <u>plots</u>-plots will have same <u>problem</u> as stated above.
- Sewage and Sullage both are taken to community STPs and treated water recycled: A comprehensive sewage collection system, along with community STPs / TTPs and recycling system is developed. Though this will involve some extra infrastructure cost on account of collection system and distribution of recycled water but this is the safest way of treating the total sewage. In this system the tertiary treated water can precisely be distributed to urban greens / parks, different industries for washing and for flushing use in residential areas.

As prescribed in CPHEEO manual, it is assumed that 80% of water actually supplied at consumer end for domestic use and 60% of water supplied to industries be generated as Sewage/ waste water. While working out sizes of collection system and capacity of Sewage Treatment Plant, provision has been kept for 20% infiltration through sewer lines. But while calculating the water available for recycling, the infiltration has not been considered, assuming that during summers and winters the infiltration shall almost be negligible. Accordingly, the sewage generated capacity of STPs and Tertiary Treatment Plants (TTPs) required has been worked out and shown in Table 7-3.

Table 7-3: Sewage Generated, Capacity of STPs & TTPs required

| I | Table 7 3. Sewage Generated, Capacity o | 19113 6 1111 | o required | |
|----------|--|------------------|------------------|-------------------|
| S | ewage Generation & Treatment Plants Capacity | 2016 | 2031 | 203 4 |
| Sewage | Generation in mld | 17.23 | 85.01 | 118.86 |
| Capacity | y of STPs required | 17.00 | 85.00 | 119.00 |
| Capacity | y of TTPs Required | 12.00 | 57.00 | 80.00 |

The recycled water shall primarily be used for proposed urban greens as horticulture requirement and the remaining shall be used in industries mainly for cleaning/washing and in residential areas for flushing etc.

Considering the topography of the area, pace of development and land use of IDP, the entire IDP area is divided into 5 Sewerage Zones. The related Tertiary Treatment Plant is also proposed to be installed on the side of STP. The Capacity of STPs and TTPs proposed zone wise is being given in Table 7-4.

Table 7-4: Zone wise Capacity of proposed STPs and TTPs in IDP Area

| Sewerage Zone | Capacity of STP | Capacity of TTP |
|-----------------|------------------|-----------------|
| Sewerage Zone 1 | 36.89 | 24.8 |

| Sewerage Zone | Capacity of STP | Capacity of TTP |
|-----------------|-------------------|------------------|
| Sewerage Zone 2 | 19.04 | 12.8 |
| Sewerage Zone 3 | 20.23 | 13.6 |
| Sewerage Zone 4 | 16.66 | 11.2 |
| Sewerage Zone 5 | 26.18 | 17.6 |
| Total Capacity | 119.00 | 80.00 |

7.3.27.3.4 SEWAGE COLLECTION SYSTEM

The Sewage/Effluent collection system is provided to collect the domestic sewage / industrial waste water from the residential/industrial areas and to convey it to the proposed Sewage Treatment Plant of that zone. Since industrial waste water is very meagre in quantity, thus common collection system is provided for sewage and waste water collection. The zoning and collection network is proposed in such a way that the flow of sewage follows natural slope and conveys the sewage to treatment plant (located at the lowest elevation) under gravity flow. The location of Sewage Treatment plants along with Tertiary Treatment Plants is given in Annexure 7-1.

The Sewage Collection system is being proposed at sector level roads only. The internal sewers including laterals shall be provided by the land developers themselves, which shall further be connected to trunk sewerage system. The detailed note on sewerage system is given in Annexure 7-1.

7.3.2.1 SEWAGE / WASTE WATER TREATMENT AND TERTIARY TREATMENT PLANT

It is proposed to provide conventional Activated Sludge Process type of Sewage / Treatment Plant. The plant shall comprise Coarse screen chamber, Sewage pumping station, Fine screen chamber, Grit chamber, Oil and Grease traps, Activated sludge type Aeration Chamber with Fluidized Bed Reactor or Moving Bed Biofilm Reactor, Secondary Sedimentation tank, Air Blowers, Sludge pumps, and Sludge drying mechanism.

The Tertiary Treatment Plant (TTP) shall comprise pre-chlorination chamber, rapid gravity sand filters and post chlorination mechanism. The TTPs are designed to receive an inflow of 85% of Sewage generated assuming 15% losses in STP. The losses in TTP are taken as 5%.

7.3.2.2 REUSE OF TERTIARY TREATED WATER

The Sewage treated in STP and then the secondary water treated in Tertiary Treatment Plant in each zone shall be collected in individual Clear water reservoir, wherefrom it shall be pumped for horticulture / industrial use and for flushing in the same zone. The water shall be collected by individual users in their ground tanks for their use. Provision has been taken for Clear water reservoirs, pumping machinery and distributaries rising mains DI Pipe class K-9.

7.4 <u>7.4..</u>RIVERS AND ROAD SIDE DRAINAGE

Two major rivers and a small nalla of about 8 to 15 meters width are passing through IDP area, a detailed map showing these rivers is given in Annexure 7-1.

In general the drainage of the area is from North East (where high hills are seen) towards South West. Terrain of the area is plain except to follow the drainage pattern towards rivers. The levels range between 32 to 24 meters on Eastern boundary of IDP and 5 m to 12-13 meters on Western boundary. Though in the hilly terrain in North East of IDP, but outside IDP boundary the levels range between

400 to 500 m on hill peaks. <u>Two major rivers and a small nalla of about 8 to 15 meters width are passing through IDP area, area; a detailed map showing these rivers is given in Annexure 7-1.</u> The details about these rivers are given below:

- Gadhi or Kalundri River: It has two tributaries. On one of the tributaries is Gadheshwar dam at the foot hills. One of the tributary as well as the main river passes through IDP area. The river flows from North East to South West direction. The river originates from the hills on the North East side of IDP area. All drainage from the north east side of IDP area goes to this river/ its tributaries.
- **Kolkhewadi River:** This River flows from East to west through southern part of IDP area. The levels ranges from 30 m to 8 meters except for the hilly terrain. It meets with the Gadhi River outside IDP area and finally discharges in to the sea.
- One small nala of about 8 to 15 meters in width also passes through IDP area. It flows from East of IDP area to south and finally meets the Kokhewadi River. It is very much meandering in nature and divides the total IDP area almost in two equal halves.

The rivers flowing in IDP area were checked for flooding at critical intensity of rain fall. It was done as per empirical formulae suggested by Indian Meteorological Department. It was found that in general no flood situation is seen in IDP area.

Methodology adopted for checking the rivers for flooding

CIDCO had provided topographic data along these rivers. The topographical survey along rivers survey was reported to be carried out for study of rivers by CWPRS for the proposed project of new International Airport near Panvel. Based on these survey levels, "L" Sections and Cross-sections along the rivers were generated and used for analysing maximum water level at major / critical points during maximum intensity of rain fall.

Analysis for Maximum Intensity of rain fall:

The data for maximum one day rain fall at Santacruz rain gauge station from the year 1950 to 2005 and at Colaba rain gauge station from the year 1901 to 2005 were made available by CIDCO along with - The hourly rain fall data for 26th July 2005 2005 (the date of worst observed flood in Mumbai) for these stations was also provided. Based on these data, the maximum intensity of rainfall at 100 years return period was worked out as per norms and procedure recommended by Indian Meteorological Department.

However, the maximum hourly rain fall at other stations within Mumbai did not record such a high rain during any hour on the day (26th July 2005). The highest rain fall recorded at other stations on 26th July 2005 is as follows:

Table 7-5: Maximum hourly Rainfall at Other stations in Mumbai (26th July 2005)

| Rain gauge station | Time | Hourly rain fall (mm) |
|--------------------|---------------|-----------------------|
| <u>Colaba</u> | <u>16 hrs</u> | <u>136</u> |
| <u>Santacruz</u> | <u>16 hrs</u> | <u>190.3</u> |
| Panvel | 12 to 13 hrs | 76.0 |
| Kharghar | 10 to 11 hrs | 105.0 |
| Nerul | 14 to 15 hrs | 72.5 |

| Rain gauge station | Time | Hourly rain fall (mm) |
|--------------------|--------------|-----------------------|
| Vashi | 07 to 08 hrs | 100.0 |
| CBD Belapur | 09 to 10 hrs | 105.0 |

Thus by using the suggested Table (Annexure 7-1) for conversion of 944.2 mm point rainfall in to areal rainfall for a recorded 16 hours duration and for 125 sq kmkm² catchment, the coefficient for maximum one day areal rainfall for the catchment reads as 93% (By interpolation of 100 and 150 sq kmkm² area). Therefore, the suggested maximum areal rainfall in 24 hours for 100 years return period comes as 878.1 mm.

So, the Critical intensity of rainfall as per IMD recommendations is = $0.16 \times 878.1 = 140.49 \text{ mm}$ per hour.

The rivers flowing in IDP area were checked for flooding at critical intensity of rain fall. It was done as per empirical formulae suggested by Indian Meteorological Department. A preliminary study indicates that in general no flood situation is seen in IDP area. A separate study is being carried out by CIDCO through M/s DHI in this regards.

7.5. INTENSITY AS PER ANALYSIS OF IIT MUMBAI:

7.4.17.5 STORM WATER DRAINAGESTORM WATER DRAINAGEROAD SIDE DRAINAGE

The Storm water drainage system is provided to collect the rain water with in the project area and to cater it to the natural drains / rivers within the project area which in turn are discharging in to the Arabian Sea on west of NAINA. The area in general is having a slope from North East to South West direction. Due care has to be taken during design of drainage system, that the drains flow along the natural slope of ground, to avoid unwanted earth work during construction. The drainage system shall be proposed on both sides of proposed roads.

As the drains are discharging in to the natural drains with-in project area, it is proposed to create few water harvesting structures at suitable locations. For this, it is proposed to construct low height weirs of 1.5 m, based on the adjoining contours. The rain water collected from the proposed drains shall be stored in these weirs. This will help in improving general water table in the area, and will also give a good aesthetic and environmental view in the green buffer surrounded with woods. The detailed note on proposed drainage system is given in Annexure 7-1.

Design Criteria and Parameters

The design of storm water drainage system is to be based on IRC - SP: 50 (Guide Lines for Urban Drainage). This involves:

• Calculating the total discharge that the system will be required to drain off.

- Fixing the slope and dimensions of the drain to have adequate capacity to carry the discharge and afford proper maintenance.
- The discharge is dependent upon intensity and duration of precipitation characteristics of the area, and the time required for such flow to reach the drain. The storm water flow for this purpose has been determined using the rational method, as suggested in IRC—SP: 50 for road side drains.
- The road side drains are not to be designed for the peak flow of rare occurrence; however it is necessary to provide sufficient capacity to prevent too frequent a flooding of the drainage area. However it is recommended that road side drains be designed for 2 years return period, and the natural drains passing nearby for a 5 year return period. However, CIDCO in its guide lines circulated has recommended that Sectoral and Nodal drains be designed for 10 years return period, thus drains shall be designed for 10 years return period.
- The detailed note on proposed drainage system is given in Annexure 7-1.

7.6 7.5—SOLID WASTE MANAGEMENT

7.6.1 7.5.1 PROJECTED QUANTITY OF SOLID WASTE GENERATION

This section deals with the projection of solid waste generation with respect to the projected population of the IDP area and per capita waste generation. The population projections made in this report and a per capita waste generation rates (of 600 gm per capita for resident population) are used for estimating future waste generation trends. The rate of waste generation throughout the horizon year of 2011-2034 is considered uniform i.e. 600 gm per capita per day. The following table shows the projected quantity of waste generated. As per the projections, the total population in the year 2034 will be 6 lakhs while the quantity of waste generation will be around 360 tons per day.

| Sr. No. | Particulars/year | 2021 | 2031 | 2034 |
|---------|----------------------------|---------|---------|---------|
| 1 | Projected population | 110,000 | 430,000 | 620,000 |
| 2 | Solid waste generation tpd | 120 | 300 | 360 |

7.6.2 7.5.2 SOURCES OF SOLID WASTE GENERATION

The main sources of solid waste generation will be residential areas, commercial areas, hotels, institutional areas, markets and other such areas. There are no industries proposed in the IDP hence it is unlikely that substantial industrial waste will be generated. The other sources of waste generation are street sweeping, drain de-silting activities, tree cuttings and leaf litter from gardens and opens spaces and construction wastes/ debris also called as construction and demolition wastes.

7.4.27.6.3 COMPOSITION OF WASTE

The area being a green-field development, no data on composition of waste is available. Hence standards mentioned in the CPHEEO manual are assumed for composition of waste which is further used for calculating the area required for landfill site.

| Sr. No. | Parameter | % of waste as per CPHEEO Manual |
|---------|------------------------------|---------------------------------|
| 1 | Total organic content | 44.57 |
| 2 | Paper | 2.91 |
| 3 | Rubber, leather & synthetics | 0.78 |
| 4 | Glass | 0.56 |
| 5 | Metals | 0.33 |
| 6 | Inert Materials | 43.59 |

7.4.37.6.4 STAGES OF WASTE MANAGEMENT

The key stages of solid waste management include collection, transportation, transfer station or storage (if required), treatment and disposal. These are briefly described in the following sections.

7.4.47.6.5 WASTE COLLECTION

Door-to-door collection: Door-to-door collection of waste is recommended in all the areas. The waste collection shall be carried out using compactors, in gaothan <u>or</u> areas <u>or those</u> having narrow street widths small compactors or containerised push carts may be <u>allowedused</u>. Each such push cart will have four HDPE containers of 1m x 0.69m x 0.15m size. The push cart for door to door collection will be provided with a bell so that the residents will be alerted of the arrival of the cart for emptying their waste containers <u>directly</u>—into the containers of the cart. The sanitary workers shall collect the waste from domestic, commercial and other areas in such congested zones. Solid waste should be collected within 24 hours of generation.

Litter Bins: In addition to the door to door collection, litter bins are recommended to be provided in public places such as gardens, bus stops, at regular intervals on streets in commercial and institutional areas. These may be provided at 50 m interval or as per the land use and density of people. The capacity may be around 0.02 cu. M. but may vary depending on the waste generation.

Street Sweeping: Street sweepers shall be assigned with fixed individual beats and 'pinpoint' work according to the density of the area to be swept. The following standards may be considered. The main roads and high-density areas shall be cleaned every day. The low-density areas can be cleaned on alternate days. Drain de-silting will be done on need basis.

| Sr. No. | Description | Norm (road length/ sweeper) |
|---------|---|-----------------------------|
| 1 | High density areas (commercial, institutional etc.) | 250m - 300m |
| 2 | Low density area | 650m - 700m |

Wherever bulk quantity of bio-degradable waste is generated such as vegetable markets, gardens, leaf litter etc. facilities for on-site composting should be explored.

7.4.57.6.6 SEGREGATION OF WASTE AT SOURCE

At present, the IDP area is rural in character, and there <u>does not</u> exist a system of solid waste management. Segregation of waste at source shall be implemented primarily in residential areas, where door to door collection of waste is proposed. Separate collection and storage of the biodegradable and

non-biodegradable fraction, dry and wet waste of the waste from households, shops and restaurants shall be carried out by the sanitary workers. For this purpose, the residents would be asked to store the biodegradable and non-biodegradable waste separately. Also, the push-carts/ compactors would be provided with two separate compartments in different colours for collection of the bio-degradable and non-biodegradable waste. Awareness programs should be conducted to train the people about the segregation of waste at household level. It is mandatory to segregate waste into bio-degradable and non-biodegradable as per the Municipal Solid Waste Management (MSW) Rules 2000.

7.4.67.6.7 TRANSPORTATION

The MSW Rules 2000 stipulate that carrying solid waste in open vehicles is not permissible. Thus mechanical compactors of adequate capacity will be used. These usually have a capacity of 6 to 8 cu. m. For congested areas mini-tipper of 1.8 cu. m. capacity can be used.

7.4.77.6.8 TREATMENT AND DISPOSAL

The characteristics and quantity of solid waste generated primarily influence the disposal options. A review of the solid waste analysis results for most Indian towns and cities indicate that nearly 50% of the waste generated is organic in nature, as per CPHEEO Manual it is 45%. In terms of the quantity, this works out to about 162tpd for the horizon terminal—year of 2034. The organic component of the waste (45% of the total waste) shall be composted and the rest of the waste shall be land filled.

The construction and demolition waste mainly consists of earth, stones, concrete, bricks, lumber, roofing materials, plumbing materials, heating systems and electrical wires and parts of the general municipal waste stream, but when generated in large amounts at building and demolition sites, it will generally be removed by contractors for filling low lying areas. The recyclable material such as metal, wood, plastic will be recycled and a small percentage will be available for disposal at landfills.

The other technology options will not be suitable, due to the following reasons

Incineration: Due to low calorific value and high moisture content, this technology is not suitable for Indian Solid waste—management. Also capital, O&M costs will be very high.

Pyrolysis and Gasification: This process involves thermal decomposition at high temperature and besides recovering energy from the waste willwaste. It will ensure proper destruction of waste—is possible. But due to the composition of the waste and high moisture content the application of this process is only limited.

Pelletisation: Making fuel pellets is another option. Low calorific value wastes will not be suitable unless ingredients are added to increase calorific value. While a few Pelletisation plants are operating in India, long periods of project development and establishment are the hindrances in this method their large scale replicability at this stage.

Bio-Chemical Conversion: This is based on decomposition of organic matter to produce methane Gas. Anaerobic digestion in closed container can produce bio-gas to the tune of 50 to 150 m³ per tonne of waste .Gas can be used for cooking, heating, or generation of electricity. Several schemes of biomethanation plants are being planned in India.

Considering the limited experience of above technologies, the daily quantity of waste generated and also as the surrounding areas being predominantly rural, it can be safely presumed that the composting will be suitable and will find a good market within the region.

The proposed disposal strategy for IDP area is as follows will be:

- Compost the organic fraction of the waste 162 tons/day for the terminal year 2034
- Sanitary land filling of inorganic fraction of waste and 20% compost rejects (240 tons/day in year 2034)
- Encouraging local level aerobic composting and
- Educating the community on 4R strategy (Reduce, Reuse, Recycle and Recover)

Sections below discuss the various aspects of implementing the above strategy.

7.4.87.6.9 LAND REQUIRED FOR DISPOSAL SITE

Area requirement for the composting and land fill sites is assessed for the <u>horizon terminal</u> year 2034. At 360 tons per day, the (45%) waste for composting works out to be 162 tons per day, and that for the land filling is 230 tons (including 20% compost rejects) by the design year. The design capacities have therefore been considered as 162 tons for composting and 230 tons for land-filling.

As summarised in below, the area required for disposal of waste for IDP area works out to a total of 5.5 ha. This comprises 0.5 ha of land for composting and 5 ha for land filling of the inorganic waste. These area calculations form the basis for identifying the new disposal site or assessing the adequacy of the proposed composting site. Summary of land required for disposal site is given in Table 7-6 below.

| Sr. No. | Component | Specification | Area requirement |
|---------|-------------------------------|--|--------------------------------|
| A | Windrow Composting | | |
| 1 | Capacity of plant | $162 \text{ tons/day} = 262 \text{ m}^3$ | |
| | | $(1 \text{ ton} = 1.67 \text{ m}^3)$ | |
| | Type of composting | Manual Aerobic | |
| | Area for windrows for 21 days | 21 nos of 2.0 X 1.5 m | $55.8x88 = 4910.4 \text{ m}^2$ |
| | fermentation period | Height, Length of Windrows – 88 m | Say 5000 |
| | Spacing of windrows | 0.6 m | (0.5 ha) |
| В | Sanitary landfill | 230 tons/day | |
| | | (198 tons/day inorganic + 32 tons/day | |

Table 7-6: Summary of land required for disposal site

| | | compost reject) | |
|---|--------------------------------------|--|---|
| 1 | Assumptions | | |
| | Landfill life | 15 years | |
| | Waste Density | 0.85 t/ m ³ (as per CPHEEO) | |
| | Landfill height | 20 m | |
| | Volume of daily cover and settlement | 0.1 (as per CPHEEO) | |
| | Volume of liner and cover | 0.125(as per CPHEEO) | |
| 2 | Landfill area calculation | | |
| a | Total waste generation | 722700 tons | |
| b | Total Volume of waste generation | 850235 m ³ | |
| c | Volume of daily cover | 85024 m ³ | |
| d | Volume of liner and cover | 106279 m ³ | |
| e | Volume available due to settlement | 85024 m ³ | |
| f | Landfill volume | 956514 m³ (b+c+d-e) | |
| g | Landfill area | 47826 m ² | 47826 m ² (4.78 ha) Say 5 ha |

Note: The above estimates for area requirement are preliminary estimates and are expected to vary during the DPR stage

A suitable landfill based on above requirements will be identified outside the IDP area while preparing the Development Plan for entire NAINA area. The MoEF and MPCB guidelines for identifying land fill sites will be taken into account.

7.4.97.6.10 BIOMEDICAL WASTE

Bio medical waste is the waste material generated from the hospitals, dispensaries & pathological laboratories—located within the IDP area. The bio medical waste has to be collected, transported & disposed off in the manner & methods as suggested under Bio-medical waste (M & H) Rules 1998. It is clearly mentioned in this rule that the 'occupier' (a person who has control over the concerned institution / premises) of an institution generating bio-medical waste (e.g., hospital, nursing home, clinic, dispensary, veterinary institution, animal house, pathological laboratory, blood bank etc.) shall be responsible for taking necessary steps to ensure that such waste is handled without any adverse effect to human health and the environment.

In no case bio-medical waste shall be mixed with municipal solid waste. In most existing cities large hospitals have their own incineration plants and common incineration plants are set up by local authorities. There are designated agencies for collection and transportation of bio-medical waste which is then brought to the common incinerator/ disposal site. The total bio-medical waste generation is 357 kg/ day for the IDP area as worked out below. This is not a substantial quantity, however a common incinerator may be provided at the land fill site or if such a facility is set up by one of the super speciality/ general hospital it can be used by the other on payment. A hazardous waste disposal site is available at Taloja operated by private agency. The bio-medical was can also be disposed off at the Taloja site.

| Sr. No. | Medical facility | No. of hospitals | Area per hospital ha | Total area sq.m. | *No. of beds @ 100 sq. m./bed | #Biomedical waste generation @0.375 kg/bed |
|---------|---------------------------|------------------|----------------------------|------------------------|-------------------------------------|--|
| 1 | Nursing Home / PHC | - | 25 | 250000 | 250 | 94 |
| 2 | General Hospital | 6 | 0.5 | 30000 | 300 | 113 |
| 3 | Super speciality hospital | 2 | 2.0 | 40000 | 400 | 150 |
| | Total | 8 | 27.5 | 320000 | 950 | 357 |

^{*}As per UDPFI Guidelines, # As per CPHEEO Manual

7.4.107.6.11 HAZAORDOUS WASTE

There are no industries proposed in the IDP area that are likely to generate hazardous waste. Moreover hazardous waste generated if any from construction sites or any other use, such as spent oil swabs, used oil barrels etc will be collected by the authorised agency and disposed at the Common Hazardous Waste Treatment Storage and Disposal Facilities (CHWTSDF) at Taloja as per the provisions of the Hazardous Waste Management and Handling Rules, 2008.

7.17.7 POWER SUPPLY REQUIREMENT

The following standards have been adopted for the estimation of power requirement for the planning area.

Domestic Demand

- 1.5 KW per household for EWS/LIG
- 3.0 KW per household for MIG
- 4.0 KW per household for HIG

Commercial and Industrial Demand

- 1 KW per Shop
- 10 KW per Service Industrial Unit

Social Facilities and Public Utilities Demand

- Social Facilities 50 KW per 7500 persons
- Public Utilities 120 KW 7500 persons

7.4.10.17.7.1 DEMAND ESTIMATION

Based on the above standards the broad estimate for power supply for IDP Area for the terminal year 2034 is given below. The estimated population for the terminal year 2034 is 0.62 million.

Residential Demand

| Sr. No. | Household | Percentage | No. of households | Total Power requirement MW |
|---------|-----------|------------|-------------------|----------------------------|
| 1 | EWS/LIG | 30 | 41333 | 62 |
| 2 | MIG | 50 | 68889 | 207 |
| 3 | HIG | 20 | 27556 | 110 |
| | Total | 100 | 137778 | 379 |

Commercial Demand

| Sr. No. | Shops and Service Industries | Unit per 1000 persons | Estimated units | Power requirement per unit in KW | Total Power requirement MW |
|---------|---------------------------------|--------------------------|-----------------|---|----------------------------|
| 1 | Shops | 20 | 12400 | 1 | 12.4 |
| 2 | Service Industries | 2 | 1240 | 10 | 12.4 |
| | Total | - | - | - | 24.8 |

Social Facilities and Public Utilities Demand

| Sr. No. | Facility | KW per 7500 persons | Total Power Requirement MW |
|---------|----------------|---------------------|----------------------------|
| 1 | Social | 50 | 4 |
| 2 | Public Utility | 120 | 2 |
| | Total | - | 6 |

The total power supply requirement therefore works out to 410 MW say 400 MW. The power will be sourced from MSETCL. The total land area required for electric substations has been worked out in the physical infrastructure demand which is about 3.8 ha.

8. LAND DEVELOPMENT MODEL - NAINA SCHEME

8.1 INTRODUCTION

This section explains the rationale of search for alternative land development models and the recommends a suitable model for NAINA.

8.2 APPROACHES FOR PLANNED DEVELOPMENT

The key objectives of planned urban land development are:

- To obtain land for public purposes physical and social infrastructure
- To ensure inclusive growth by providing housing to the poor, and
- To raise finances by either capturing land value gains that occurs on account of provision of infrastructure or adopting the principle of 'growth pays for growth'.

The two conventional approaches to planned development have been the Development Plan model and the Bulk Land Acquisition Model. The DP <u>model</u> has been largely used in existing towns and cities such as Mumbai and Thane etc. whereas Bulk Land Acquisition <u>model</u> has been found suitable for Greenfield development like <u>in-Navi Mumbai</u> or capital cities like Chandigarh or Gandhinagar. Each has its merits and demerits.

The DP designates particular parcels of land for public purposes, which can then be compulsorily acquired. In this process landowners who lose their land bear the cost and the benefits accrue to the others. DP typically does not attempt to capture land value gains that accrue on account of such benefits. Bulk land acquisition on the other hand can potentially ensure that all three objectives of planned urban land development are achieved. However large scale compulsory land acquisition is increasingly becoming difficult.

In case of land pooling and land readjustment the burden of providing land for public purposes and infrastructure is equitably cast on all landowners. The merit of this method <u>is that</u> the land remains with the original land owners except to the extent that required for public purposes. The traditional Town Planning Schemes relied on capturing 50% of land value gains to finance implementation of TPS. The Gujarat model of development plans/ town planning schemes, in addition allow planning authorities to retain land that could be sold for financing TPS. In the Korean model of land readjustment 'cost equivalent' land was retained by planning authority.

Since in case of NAINA effective legal framework is not available, an innovative model based on voluntary participation incentivised through appropriate DCRs is necessary.

8.2.1 SUMMARY

It is necessary to appreciate that each approach will <u>have</u> some advantages and some disadvantages. The models can be grouped into three categories. The salient features of each are explained below based on land acquisition, land value capture and finances.

- 1. In conventional development plans planning authorities have to acquire land designated for public purposes with additional responsibility of rehabilitating the displaced persons. The land value gains cannot be captured in this model. Hence external funds are necessary.
- 2. Voluntary land pooling primarily responds to the demands of the market. As the approach is voluntary there may be holdouts by certain landowners, which may frustrate the development leading to uncertain outcomes. Incentives for participation in the scheme as well as some disincentives for not participating are necessary to make the scheme attractive and ensure maximum participation. Retaining land for subsequent sale by planning agency could raise resources for financing the development.
- 3. Development of new towns with 100% acquisition of land is faced with the same problems of land acquisition and rehabilitation of displaced persons although planned and inclusive development is possible in this method. The land value gains can also be fully captured.

For NAINA a model belonging to category 2 above has to be developed.

8.3 EXISTING REAL ESTATE SCENARIO

Since the intended model is market dependent an appreciation of current real estate market is desirable. The land prices in Navi Mumbai and surrounding areas, including that of CIDCO have been increasing steadily. The announcement of the development of Navi Mumbai International Airport has further fuelled the increase in real estate prices. The average price for residential flats in the area around Panvel is about Rs.5400 per sq. ft². As per the ASR the land prices in Vichumbe village were Rs. 27,60,000 per Ha in 2013 and are Rs. 31,74,000 per ha in 2014, which shows an increase of 15%. Substantial development is happening in the form of Urban Village Schemes, Special Townships, Rental housing schemes.

The existing and proposed transport network such as NH4, NH4B, Mumbai –Pune Expressway, proposed Alibag-Virar Multi Modal Corridor, Panvel – Karjat suburban rail, Vasai-Diva- Panvel suburban rail, doubling of tracks between Panvel and Roha by Konkan Railway are further fuelling the real-estate prices. Besides this the Delhi-Mumbai Industrial Corridor, Dedicated Freight Corridor and Mumbai – Bengaluru Industrial Corridor are likely to act as impetus for rise in the real estate and land prices. Thus it is very likely that with provision of basic infrastructure for planned development in place, land values may increase rapidly that could be tapped for financing development.—

8.4 PROPOSED LAND DEVELOPMENT MODEL FOR NAINA

After studying various development models adopted across the country, including Special Township schemes and development approaches adopted by CIDCO in the past particularly at Waluj a base model was proposed. This model underwent rigorous scrutiny based on inputs received from various stakeholders. The model is now coined as 'NAINA Scheme'.

Its key principles are:

- a) Incentivize aggregation: Since bulk land acquisition is difficult and time-consuming, SPA-NAINA will have to incentivize land aggregation by owners. The incentives to be given are additional FSI on aggregation, compared to low FSI for individual plot developments. Incentives to be given in the form of dPiscount in infrastructure development charges, comprehensive Environment Clearance, provision of supporting infrastructure by SPA-NAINA and deemed N.A. permission. Minimum area of aggregated land eligible for NAINA Scheme shall be 107.5 Ha (4 Ha. In Urban Village).
- b) Sharing of Land: In NAINA scheme, For area 10 Ha or above, Tthe owner/ developer will retain 60% of the land and 40 % land shall be surrendered to SPA-NAINA "free of cost by consent agreement" for providing roads, open spaces, amenities and growth centre. The permissible FSI for the entire plot will be 1.00, which can be consumed on the 60 % of retained land resulting in net FSI of 1.7 for the retained land. In case of NAINA- Scheme having areas between 7.5 ha and less than 10 ha, 50% land will have to be surrendered to SPA-NAINA, resulting in FSI 2 on land retained by owner/ developer. If more than 40% land area is affected by reservations, landowner is to be compensated for loss of land in excess of 40% than the land to be surrendered as stated above, by allotting part alternative land elsewhere and part TDR s within same sector way of partly by TDR and partly by land compensation. Alternatively in lieu of land, the options of onsite TDR or monetary compensation would also available.
- c) Raising Finances: The finances required for developing city-level infrastructure will be raised from development charges, are leviable under the MRTP Act, 1966. The prescribed <u>charges</u> are proposed to be enhanced by 5 times. The second source of revenue will be disposal of 15 % land reserved for growth centre. The outcome of NAINA Scheme being market dependent is intrinsically uncertain. To overcome the risk and uncertainty of outcome following strategy is proposed:
 - Land designated for roads, amenities and growth centre as shown on the PLU of IDP shall be notified for compulsory acquisition
 - NAINA Schemes can be formulated incorporating roads and amenity reservations. These
 will be counted towards 40% of the land to be surrendered to SPA-NAINA
 - Landowners whose land is notified for acquisition for growth centre if willing to contribute 40% of the land free of cost, will be compensated for on 60% of the land by way of TDR and alternate land in the ratio of 1/3:2/3.
- d) Inclusionary housing: Additional 20% BUA, over & above BUA generated on 60% land, shall necessarily be constructed for EWS/LIG housing and this additional FSI is being permitted free of cost. The constructed tenements of EWS/LIG will be handed over to CIDCO at predetermined rates. All developments on lands admeasuring 4000 m² or more shalll have provisions for Inclusive housing. In case of plotted development 20% of the plots or land parcel constituting 20% area shall be reserved for inclusive housing (ie. EWS/LIG). In case of plots the area shall be between 30 50 m². Such plots/ land parcel will be sold to SPA-NAINA as per the prevalent ASR(Annual Schedule of Rates). Such plots/ land parcel can be located anywhere in the IDP area. The developer shall be entitled for the FSI of such plots/land which can be consumed on the same land or can be availed in the form of TDR as per the Development Control Regulations. In case of group housing 20% of the built up area shall be utilized for constructing EWS/LIG tenements anywhere in IDP area. In case of NAINA –Schemes in Urban

Villages the requirement will be 10% instead of 20%. All other conditions shall be as per the Government Resolution on affordable housing as amended from time to time.

8.4.1 PROVISION OF LOCAL INFRASTRUCTURE:

The internal layout of 60% of the land retained by the landowner shall follow the standard layout regulations in terms of provision of internal roads, infrastructure, recreational open space and local amenities.

FEATURES OF THE PROPOSED MODEL

- a) Area requirement: Considering the existing situation and market scenario promoting townships on smaller areas than those proposed in Special Township Policy would be feasible. Minimum land area or land aggregation required for participating in 'NAINA Scheme' is 10 7.5 Ha. For areas outside of urban villages and within urban villages the minimum area is 4.0 Ha.
- b) Permissible Uses: Uses permissible on owner's land are Residential, Commercial, R+C, Hotels, Offices etc. The whole of retained land can also be used for institutions like residential schools, hospitals, college with hostel, research and development institutions etc.
- Development of Growth Centres: Growth centres, will be exclusively developed by SPA-NAINA.

 These -will act as catalysts for urban development and these will be designated in the development plan based on various parameters such as proximity to transport network, existing urban centres and development potential.

d)c) FSI and BUA for 'NAINA Scheme':

| Particulars Particulars | Area of land (Ha.) | Permissible BUA in Ha | FSI |
|-------------------------|-----------------------------|-------------------------------|-----------------|
| | | 10.005.00 (Constructed | |
| Total Area of Scheme | 10.00<u>5.00</u> | on the land retained | 1.00 |
| | | with the owner) | |
| Land with owner | 6.00 3.00 | 10.00<u>5.00</u> | 1.70 |
| EWS/LIG (20%) | - | 2.00 1.00 | 0.20 |
| Land with CIDCO | 4.002.00 | - | - |
| Growth Centre | 1.50 0.75 | 2.55 1.275 | 1.7 |
| Amenities | 0.50<u>0.25</u> | -0.5<u>0.25</u> | 1.0 |
| Roads | 1.00 <u>0.50</u> | 0.00 | 0.00 |
| Open Spaces | 1.00 0.50 | 0.00 | 0.00 |
| Total Area | 10.00<u>5.00</u> | 15.05 <u>7.525</u> | |

8.4.2 LOW INCOME HOUSING

It will be mandatory for every land owner to construct 20% of the BUA on his land as low income housing. This 20% BUA will not be counted in the FSI of 1.7 granted to him. The dwelling units for low income housing shall have carpet area not exceeding 30 sq.m each. Such dwelling units shall never be allowed to be merged into larger dwelling units. These units will be handed over to SPA NAINA at a predetermined rate.

8.4.38.4.20PTIONS FOR NON-PARTICIPATING LAND OWNERS

For landowners unwilling to participate in NAINA-Scheme, the FSI shall be 0.5 and no additional FSI on payment of premium or by any other mean shall be granted for such non-participants. But for those

whose layouts are less than 10 ha and are ready to surrender their lands under reservations, instead of going through acquisition process, additional FSI of 0.2 will be permissible on surrender of the reservations under acquisition.

All the non-participants have to pay Development charges as per Section 124(B) of the Act and Offsite City Service Delivery Charges (OCSDC) @ 25% at the time of issuing Commencement Certificate, 25% at time of granting Occupancy Certificate and 50% on completion of major road infrastructure.

All lands above 4000 sq. m₂.-will attract provisions of low income inclusive housing_{.5} which will be provided as detailed in 9.3.3.4.

8.4.48.4.3INTEGRATING EXISTING POLICIES

The study of existing plans and policies has revealed that the MMR Regional Plan 1996-2011 and certain other policies of the Government of Maharashtra have implications on the development of the region. These will have to be effectively integrated in the proposed development model to achieve proper development of the <u>IDP plan</u> area. The key policies that need to be integrated are the Urban Village Schemes, Special Township Policies in MMR and Rental housing scheme of MMRDA. The details of these have been explained in Chapter 9.

8.4.58.4.4 DEVELOPMENT GUIDELINES FOR GROWTH CENTRE LANDS

- a) The FSI permissible on growth centre lands shall be 1.7, at par with the FSI of land retained by the landowners in 'NAINA scheme'.
- b) No amenity space shall be provided in Growth Centres.
- c) Only internal and layout roads and open spaces will be required to be provided without losing FSI potential.
- d) The Growth centre shall not be used for <u>EWS/LIG_inclusive_housing</u> or development of Social facilities.
- e) The Growth centre land shall not be allotted for any request of land by Govt./Semi-Govt. Agency at concessional prices.

SPACE LEFT INTENTIONALLY BLANK

9. SALIENT FEATURES OF DEVELOPMENT CONTROL AND PROMOTION REGULATIONS

9.1 INTRODUCTION

The Development Control and Promotion Regulations are a mechanism to facilitate the implementation of the Interim Development Plan and carry out planned development. The DCPRs are largely based on the "Standardized Development Control and Promotion Regulations for Regional Plans" prepared by the Urban Development Department, Government of Maharashtra. These DCPRs have been contextualised for the IDP.

9.2 OPTIONS FOR DEVELOPMENT

For the purposes of DCPRs, IDP Area has been divided into four categories viz; Gaothan, Urban Villages, NAINA-Scheme and Non-NAINA Developments Developments Scheme.

Development in Gaothans: Gaothans will be as defined in the Maharashtra Land Revenue Code (MLRC) Code Section 122 and as shown on the IDP. As Gaothans are built areas it is expected that mostly redevelopment proposals will come for approval. No FSI is proposed; instead built-form will be controlled by footprint and number of storey. Existing footprint will have to be retained and maximum two storeys are permissible including ground floor. To facilitate wider access ways buildings abutting such existing access ways less than 4.5 in width will be setback by 2.25 m from the centreline of the existing access. Most exitingexisting uses will be continued.

Urban Villages: Urban villages are areas of 200 m around existing inhabited gaothans as marked on the IDP. As per the existing MMR Regional Plan these areas are permitted an FSI of 1 and a maximum building height of 13.515 m. This regulation has been retained in order not to deprive the land owners of the existing development potential. The land holdings in these areas are small and hence they may not be able to aggregate to 10-7.5 ha land to be part of the NAINA-Scheme, though there is no restriction on them forming part of the Scheme if they manage to aggregate such land partly within 200 m and partly outside 200m. Furthermore considering the land-holding pattern a smaller land assembly scheme is proposed for urban villages. If the owners aggregate a minimum of 4 ha land they will retain 60% of the land and contribute 40% of land to SPA-NAINA. Within the land retained by the landowners open spaces at 10% of the land will have to be provided however provision of amenity space will be optional. It shall be mandatory that if the NAINA —Scheme is for 4 ha only then all of such 4 ha land shall be within 200m of the Gaothan.

NAINA-Scheme: The minimum area required for participating in NAINA scheme shall be 107.5 ha_and For area 10 Ha and above 40% land will be surrendered to SPA-NAINA free of cost. Developer will be allowed to use FSI of entire land on balance 60% of retained land. In case of NAINA- Scheme having areas between 7.5 ha and less than 10 ha, 50% land will have to be surrendered to SPA-NAINA and the FSI on balance land will be 2.0.. There will be a two-stage approval process. In first stage an Outline Development Permission will be granted based on verification of details of ownership, and proposed allocation of land to be surrendered to SPA –NAINA. Final Permission will be granted based on detailed layout plan, building plans, infrastructure availability, project report etc. Depending upon the size of the scheme and the number of dwelling units proposed a graded range of amenities to be developed by the developer has been proposed. This will include basic education and health facilities. In case developer surrenders built amenity to SPA-NAINA, TDR equivalent to construction value based FSI of developed amenity shall be awarded to developer.

Incentive FSI for larger aggregation of land is proposed in NAINA scheme as given below;

| Gross Area of NAINA Scheme (ha) | Gross FSI | FSI land retained by developer |
|---|------------|--------------------------------|
| 7.5 ha and above but less than 10 ha | <u>1.0</u> | <u>2.0</u> |
| 10-25 10 ha and above but less than 25 ha | 1.00 | 1.7 |
| 25 ha and above but less than 40 ha 25-40 | 1.08 | 1.8 |
| Above 40 | 1.14 | 1.9 |

Individual Plots (Non- NAINA_-Development Scheme): The FSI permissible for such developments will be 0.5 and layout regulations as per Standardized Regulations for DCPR for RP are applicable.

Special Township_SchemeProject: In case of already approved schemes projects Development Charges payable or paid as per Chapter VI-A of MRTP Act will be payable by the developer. In case of new proposals developer will have to surrender 15% land as decided by SPA-NAINA. This 15% will be exclusive of IDP reservations if any. SPA-NAINA will be approving and sanctioning authority after grant of Locational Clearance under Rule 7(a), i.e. for Letter of Intent under Rule 7(b) and Final Approval under Rule 7 (c) of STP regulations.

Rental Housing: OCSDC at 2 times the the applicable standard rate of Rs.2311.80 per sq.m²— shall be charged in instalments as decided by the SPA-NAINA from time to time. As of 2015 the OCSDC rate is Rs. 2311.80 per m²

9.3 FEES, CHARGES AND PREMIUMS

Development charge: The development charge is proposed to be increased by 5 times the existing rates prescribed in MR&TP Act.

Offsite City Service Delivery Charges (OCSDC): These are charges framed by SPA-NAINA, payable to SPA-NAINA by persons seeking development permission who would be using the city-level physical and social infrastructure developed by SPA-NAINA without contributing any land to SPA-NAINA. The IDP area being largely rural and green-field area there is no physical and social infrastructure available necessary for urban development. In order to generate revenue for SPA-NAINA to provide this infrastructure it is proposed to levy OCSDC. This OCSDC will be charged in urban villages and development that are not under NAINA scheme.

9.4 OTHER SALIENT FEATURES

- There will be no restrictions on height of the building, except those governed by Civil Aviation and Fire Safety Act whichever is less
- Definition of amenity amended to exclude public utilities
- Rules for tree plantation:
 - Every plot of land shall have at least 1 tree for every 100 sq. m² or part thereof
 - Recreational open spaces shall have at least 5 trees for every 100 sq. m².
- Rules for size of hoardings and fees and deposit charged for erecting hoarding
- Regulations on Environmental Sustainability and Public safety included
- Existing quarry to be permitted as on-going activity, no new quarries will be permitted
- •

10.BLOCK ESTIMATES & FINANCING DEVELOPMENT

10.1 INTRODUCTION

It is necessary to have fair estimate of the expected revenue and the expenditure for the proposals envisaged in the IDP. Accordingly, the MRTP Act 1966 under section 26(v) specifies that the plan should contain "an approximate estimate of the cost involved in acquisition of lands required by the Planning Authority for the public purposes, and also cost of works as may be necessary". In case of a SPA engaged in Greenfield development having no recourse to tax revenues, it is imperative to prepare a financing plan for implementing the IDP.

10.1.1 COST OF DEVELOPMENT

All the lands shown on the plan as reservations and Growth Centre will be acquired. This area is about 961 Ha. This includes area under roads, public utilities, social facilities, amenities and growth centres. Presently the highest non NA stamp duty RR rates applicable in IDP is about Rs 400 per m². Considering the rate to be double four times of this, the acquisition cost would be about Rs 16800 per m². Further, it is expected that only 20% land need to be acquired under LARR 2013 and balance 80% will accrue by way of land assembly. Accordingly, the approximate cost of land acquisition would be about Rs. 150-262 Crs.

The demand for amenities was assessed and has been discussed in detail in chapters 4 & 7. The estimates for the facilities and amenities, which have to be provided by Government Agencies has been worked out as per Schedule of ORates of CIDCO wherever possible, issued in the year 2012-13, with suitable price escalation added to it to bring the cost at 2014-15 level. For other items, the block costs have been used for estimation. The summary of estimated cost is given in Table 10-1.

Table 10-1: Cost of development (Rs in Crores)

| 13 12 | CONSTRUCTION OF INFRASTUCTURE | AIED U | N THE LUAN REQUIR | ED FOR THE |

It has been assumed that infrastructure would be provided from 2015 to 2029 2028. In the initial period of 5 years from 2015 to 2020, basic infrastructure work (road, water supply, sewerage, drainage, power etc) will be taken up on priority. The provision for Metro will wait till the city has obtains critical mass and this has been considered from the year 2024 2025 onwards. From the analysis it is clear that in the initial period, the fund requirement for infrastructure would be far more than the revenue and hence the fund would be borrowed from the market. After accounting for items listed at Sr No 11 & 12 in Table 10.1 Table 10-1 the Net Present Value (NPV) of the estimated infrastructure cost is Rs 10441 7549/- Cr. For detailed costing estimation, refer Annexure 10-1

It is assumed that the revenue generated basic amenities provided such as water supply, power supply, metro, sub-urban railway etc., shall be as part to meet their O&M .expenses thus has been taken as revenue generation in the estimations.

10.2 REVENUE SOURCES

10.2.1 REVENUE FROM DEVELOPMENT CHARGE

The MRTP act 1966 Chapter VI-A provides for Development Charge to be levied by Planning Authority, which can be used only for the purpose of providing public amenities, maintenance and improvement of the area. The development charge is payable by the applicant coming forward for development permission. It is applied on land coming for development and proposed built up area separately. For land the rate specified by the Act is 0.5% of the Stamp Duty Ready Reckoner rate for land. Similarly, for proposed built up area, the rate is 2.0% of the Stamp Duty Ready Reckoner rate for land.

The total area for IDP is about 3683 Ha.,Ha. of which, undevelopable and already built up area and developable area account for 630 Ha, 647 Ha and for about 2,46306 Ha. respectively. Considering the applicable basic rate of development charge is Rs 100/- per m² the potential revenue from Development Charge will be about Rs 901 837 Cr. The NPV for the same would be about Rs 400 370/- Cr. The total cost of development of infrastructure is estimated about Rs 10441 13071 cr. The NPV for the same is about Rs 7549/- Cr. Even if the development charge is increased by several fold (say 5 times) the anticipated revenue would be only to the order of Rs 4,505 4183 Cr and the NPV of the same would be about Rs 1,998 1852/- Cr. It is evident that Development Charge alone will not be sufficient to meet the cost of infrastructure. Due to such huge gap in revenue and expenditure, it is very clear that the Plan will remain on paper and it cannot be implemented unless additional sources of revenue are tapped. Accordingly, CIDCO has proposed additional sources for funding of infrastructure namely development and sale of land is growth centres.

10.2.2 REVENUE FROM OTHER SOURCES

In order to generate additional resources, Growth Centre of 15% of the developable land has been proposed for Growth Centre in the IDP. This land would be developed and disposed of in the market.

10.2.3 SALE OF LAND IN GROWTH CENTRES

The Growth Centres (GC) are shown in the IDP. These Growth Centres account for about 398361-Ha (about 1516% of the area expected to be available for development). Land in GC would be leased by CIDCO for mixed land use. The revenue generation has been estimateded is with the assumption that

- the bBasic rate is @ 1000012000/- per m2 in the beginning (year 2015)
- rate of With escalation is 12% upto %/yr upto 2020
- and b Beyond 2020-2020 with the rate of escalated @is-15% per annum.

With thses assumptions T-the revenue available for funding the infrastructure would be to the order of Rs 17,603 16158/- Crs. The NPV of the same by discounting @9% yearly would be about Rs 61436,693/- Cr.

10.2.4 REVENUE FROM SALE OF SOCIAL PLOT

The social facility plots are given on concessional rates to other government bodies / trusts to develop the facility. However, these plots are not provided free of cost. After considering this factor, it is expected that sale of social facilities would generate about Rs 690 1,668/- crs. The NPV of the same by discounting @9% yearly would be about Rs 717 297/- Cr.

10.2.5 OFFSITE CITY SERVICE DELIVERY CHARGES (OCSDC)

From all the above sources of revenue, the expected fund (NPV) is about Rs 9,408 Crs, whereas the expenditure (NPV) is expected to be about Rs 10,441/ Cr. The deficit is about Rs 1033 Cr. In view of this, it is necessary to identify some additional sources of revenue. From the Table 10-2 it is evident that the expenditure on the facilities to be provided within the city (peripheral infrastructure) can be met with the above revenue. However, it will not be possible to provide major city level infrastructures like Water Source development (construction of Dam); Trunk distribution lines, Mass Rapid Transit System (Metro) etc.

In view of above, it is proposed to recover additional revenue from OCSDC. The rate of OCSDC has been given in the Table 10-2.

Sl.No **Description (NPV Rs in Crs)** 4 Total cost of Infrastructure 10,441 Crs 2 Revenue from other sources 9.408 Re Crs 3 Balance required from OCSDC Rs 1.033 2,400 4 Land available for Developable Ha Land for OCSDC (less than 20% need to pay OCSDC) 450 Ha 20% of developable land = 0.2x 2400= 480 Ha. sa Rs 2,295 (say 2,300) PER M² 6 Required rate to meet expenses

Table 10-2: OCSDC Charges

City Development can not cannot take place without availability of land for infrastructure. CIDCO is proposing a voluntary Land Pooling scheme. Under this scheme owner will surrender part of land to CIDCO for development of infrastructure and will get TDR/ FSI so that he does not loses the development potential on the plot. CIDCO has gone one step ahead and given higher FSI for NAINA scheme, however, it is voluntary scheme and there would be applicants who would not like to part their land for infrastructure. In such cases CIDCO proposes OCSDC to recover cost of infrastructure and land value. This OCSDC would be leviable It is applicable only on to those applicants who do not participate in city development by way of providing part of their land to the SPA. Such charge is proposed to be levied on development not coming under conforming to NAINA Scheme. The revenue on account of OCSDC will therefore vary depending upon public response to NAINA Scheme. It is presumed that 80% of land is IDP shall come under NAINA scheme. Rest OCSDC has been considered as revenue.

10.3 IMPLEMENTATION STRATEGY

10.3.1 INFRASTRUCTURE BY CIDCO

CIDCO has developed Navi Mumbai and has vast experience in city development. CIDCO will take up construction and development of infrastructure works i.e. roads, water supply, sewerage, drainage.

10.3.2 INFRASTRUCTURE BY OTHER GOVERNMENT AGENCIES

There are few facilities and amenities which are under the domain of other government agencies e.g. power by MSEDCL & MAHATRANSCO, Police, Indian Railways etc. In such cases, CIDCO will provide land at concessional rate to these government agencies and request them to take up work related to their field.

10.4 DYNAMICS OF REVENUE

Although the costs have been estimated at 2014-15 prices the actual costs at current prices will depend upon the year in which the works are executed. The uncertainty of revenues is of higher degree as they are dependent upon the movement of land prices in time and corresponding quantum of development. The financing scheme of implementation of IDP therefore needs to be tested in terms of a cash flow analysis over 15 year period with reasonable assumptions. For details, see Annexure 10.1.

The summary of the revenue and expenditure is given in Table 10-2 Table 10.23:

Table 10-32: Summary of Revenue and Cost (Net Present Value)

| Sl.No | DESCRIPTION | Rs in Cr |
|-----------|---|--------------------------------------|
| A | REVENUE FROM ALL SOURCES | |
| 1 | REVENUE FROM DEVELOPMENT CHARGE (NPV) | 1997.99 <u>1851.92</u> |
| 2 | REVENUE FROM GROWTH CENTER (SALE OF LAND- NPV) | 6692.84 <u>6143.1</u> |
| 3 | REVENUE FROM OCSDC (NPV) | 1882.82 <u>840</u> |
| 4 | SALE OF SOCIAL FACILITY (NPV) | 717.65 297 6.8 |
| <u>5A</u> | NPV OF REVENUE FROM ALL SOURCES A | <u>91321.8</u> 11291.30 |

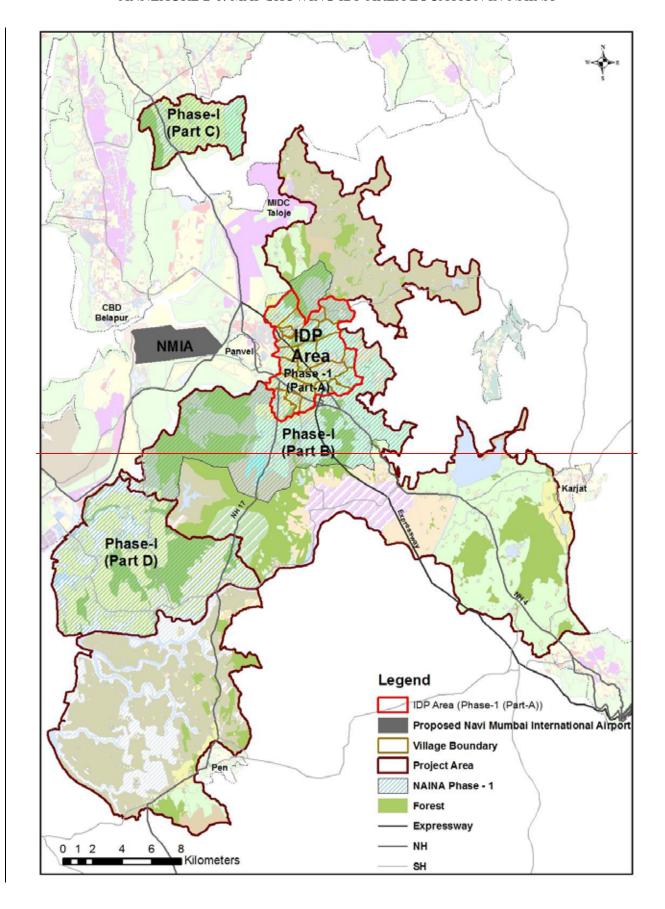

| В | NET PRESENT VALUE OF ALL EXPENSES B | 10441.37 <u>7549</u> |
|---|--------------------------------------|---------------------------------|
| C | NPV (A - B) | 849.93 <u>1582</u> |
| D | Internal Rate of Return (IRR) | 17% 20.4 % |

From the annexure 10-1, it can be seen that in the initial period (2015 to 20<u>1920</u>), the anticipated expenditure on infrastructure projects would be more than the revenue in the corresponding years. The revenue starts exceeding the anticipated expenditure on infrastructure from the year 202<u>0</u>1 onwards. However, accounting for the backlog for the period 2015-<u>20202019</u>, the year on year (y-o-y) positive opening balance is expected from the year 202<u>6</u>8. With the assumptions cited in the annexure, the NPV <u>surplus</u> (total <u>reveuerevenue</u> – total <u>expensiture</u> expenditure) of the project is estimated to be Rs. <u>849</u> <u>1582</u> Crores and the IRR works out to be about <u>17%20.4%</u>. Thus it may be inferred that the proposed development including its NAINA scheme based financing model is financially viable. <u>However</u>, there would be need for institutional funding for the initial phases say 5 to 10 years.

Notes:

- 1. The PLU map has been prepared from the base map prepared by superimposition of cadastral maps and physical features depicted from satellite imagery. Reservations have been proposed on this base map. The area of reservation and location in survey numbers are tentative. The area of the reservation would be finalized after on-site demarcation.
 - In case of any discrepancy, the survey map of the reservation under reference by the DSLR showing the reservation, physical feature (if any) and survey number, Hissa number boundary would be considered final. 7
- There are cases wherein survey number, hissa number are not available on the revenue map used for preparation of base map. In such cases, shall be referred to the DLSR for incorporating the necessary data. 3

P - Indicates Part Survey Number

ANNEXURE 6-34: PROPOSED SECTOR BOUNDARIES

ANNEXURE 7-1: DETAILED NOTE ON WATER SUPPLY, SEWERAGE AND STORM WATER DRAINAGE

INTRODUCTION

Provision of state of the art physical infrastructure is important for achieving desired quality of life in IDP Area. The aim is to develop new physical infrastructure for adequately meeting the demand for water supply, sewerage network, drainage, solid waste management and power distribution and also to mitigate with the probable flood situation in the area. In principle, it is aimed to provide independent infrastructure network within the IDP area which can be developed independently by the development authority. This trunk infrastructure network can be further extended into developable land parcels by the land developers.

The demand assessment for all the major components has been worked out based on the best engineering practices.

The major trunk infrastructure components considered for development of proposed IDP Area of NAINA have been presented below:

Water Supply,

Sewerage and recycling,

Drainage, and river training

Solid Waste Management

Power

ANNEXURE 7-2WATER SUPPLY

Availability of sustainable source of water with related infrastructure facilities is prime necessity for any modern and sustainable development. But prior to exploring for a sustainable source it is utmost necessary that actual water demand is worked out precisely based on alternate standards, bench marks and acceptable norms. The piped water supply has to be designed to provide adequately for:

Domestic needs: Including drinking, cooking, bathing, and washing, flushing of toilets, and individual gardening / air conditioning.

Demand for the employment in various work places: For Institutional needs.

Industrial use: For existing and proposed industries.

Horticulture needs: For public parks and urban greens.

Fire Fighting needs.

Unaccounted for Water: Including distribution losses, treatment losses and transmission losses.

The physical infrastructure for water supply is to be designed based on spot to spot demand. Thus for arriving at total water demand, the spatial demand with respect to location of residential, commercial, institutional and industrial complexes has been considered. Thus the proposed land use of complete IDP area has been identified and based on the land use the demand has been worked out and compiled.

Adopted Norms and Standards

Norms for domestic water demand

The quantity of water required in the houses for drinking, cooking, bathing, washing etc. is termed as domestic water demand.

The Environmental Hygiene Committee suggested certain optimum service levels for communities based on different population groups. The code of Basic Requirements of Water Supply, Drainage and Sanitation (BIS: 1172), as well as the National Building Code recommends a minimum of 135 lpcd service level for communities where the residents are provided with full flushing system for excreta disposal. The Manual of Water Supply and Treatment, issued by CPHEEO (Central Public Health and Environmental Engineering Organization), Ministry of Urban Development, and Government of India has recommended the domestic water demand as shown in below Table.

Table: Norms for domestic water demand as per CPHEEO manual

| Classification of Towns | Recommended Water Supply Levels |
|---|---------------------------------|
| Towns provided with piped water supply but without sewerage system | 70 litres per capita per day |
| Cities provided with piped water supply where sewerage system is existing/ contemplated | 135 litres per capita per day |
| Metropolitan and Mega Cities provided with piped water supply where sewerage system is existing/ contemplated | 150 litres per capita per day |

The UDPFI guidelines, issued by Ministry of Urban Affairs and Employment, Government of India, have also prescribed the standards for domestic water supply in urban areas. These are being illustrated in below Table.

Table: Standards for Domestic Water Supply as per UDPFI Guide lines

| Sl. No. | Aspect | Size of Town (bas | sed on population) | |
|---------|------------------|-------------------|--------------------|-----------------------------|
| | | Small (<50000) | Medium (>50000) | Large & Metro (> 10,00,000) |
| 1 | Absolute Minimum | 70 lpcd | 70 -100 lpcd | 135 lpcd |
| 2 | Desirable | 100 lpcd | 135–150 lpcd | 150-200 lpcd |

CIDCO has also prescribed the design norms for design of water supply systems, which prescribes a domestic water demand of 180 lpcd. The design population of IDP of NAINA area for plan horizon year is nearly 6.20 lakh. Thus based upon above three guide lines and standards prescribed by CIDCO, the domestic water demand has been worked out taking 180 lpcd service level at consumer end.

Norms for Employment Population

The water requirement for the persons working in different commercial establishments, offices, factories and educational institutions have also to be considered while working out water demand. The CPHEEO manual as well as UDPFI guide lines prescribe a service level of 45 lpcd for the employment population. Thus the same has been considered while working out the total water demand.

Norms for Industrial Water Demand

The Industrial Demand varies upon type of Industries likely to be established in the region, based upon the market assessment, raw material availability, logistics and other support facilities. The industries manufacturing leather & leather products, fine quality paper, beverages, tobacco and related products, gas and steam generation, basic chemicals, textile dying industries etc. are termed as high water intensive units. While the industries involved in manufacture of cotton textile (spinning / weaving), silk and manmade fibre, jute and other vegetable fibre, printing and publishing, rubber and plastic products, non-metallic mineral products, basic metal and alloy industries, metal products and parts, electronics etc. are termed as low water intensive units. While the demand for high water intensive units goes as high as 60,000 to 1,00,000 litres per hectare, the demand for low water intensive units ranges between 10,000 to 30,000 litres per hectare

For assessment of water demand for industries in IDP area, the type of industries in existing area was surveyed. It was noticed that the existing industries are generally Ware houses and a very few are small dry metal processing units, thus a water demand of 15,000 litres per hectare has been considered for the existing industries in IDP area.

Horticulture Water Demand

Provision has also been kept for horticulture water demand for green parks and urban greens proposed. The demand has been worked out at 67000 litres per hectare, for 60% of proposed green area and 30000 litres per hectare for balance 40% of the green area as per DSIIDC (Delhi State Industrial & Infrastructure Development Corporation Ltd.) norms.

Provision has also been kept for horticulture water demand for green parks and urban greens proposed. The demand has been worked out at 67000 litres per hectare, for 60% of proposed green area and 30000 litres per hectare for balance 40% of the green area as per DSHDC norms.

Fire-Fighting Demand

As per CPHEEO manual the fire-fighting demand is to be taken based on the formula:

Fire-fighting demand in $kl/day = 100 \times P^0.5$ (where P is the population in thousands)

Thus the same has been worked out as per above standards and added to total demand

Recycling and Reuse of Water

To reduce the fresh water demand recycling of domestic and industrial waste water is considered. The sewage generation has been taken as 80% of the water supplied for domestic use, as suggested in the Manual of Sewerage and Sewage Treatment, issued by CPHEEO, Ministry of Housing and Development, Government of India. The waste water from industries is taken as 60% of the water supplied to industries.

The infiltration in conveyance system has been kept as 20% of daily flow as prescribed by CIDCO in their norms looking to intensive rains in the area. Provision has been kept for losses in STP and Tertiary Treatment Plants, while working out availability of water for recycling. The recycled water is proposed to be used to meet the horticulture demand for urban greens, fire fighting and balance water is to be supplied to industries for washing and for flushing purposes in residential area.

Gross Water Demand

Based upon the existing and proposedresidential, commercial (employment), horticulture and firefighting demand, the gross water demand for the IDP area has been worked out.

For working out fresh water demand at consumer end, the quantity of recycled water from Tertiary Treatment Plants after subtracting the losses in the supply system has been deducted from the total demand. For working out gross water demand 28 percent losses in distribution and transmission system has been considered as per norms prescribed by CIDCO for design of water supply system.

Based upon above norms the demand for total IDP area works out as 93 mld, and if the recycling is not considered the demand of fresh water shall be as high as 178 mld. The detailed calculations are shown in below Table.

Table: Water Demand for IDP Area

| Particulars of users | <u>Pc</u> | pulation | / Area in | <u>Ha</u> | Rate of Supply | <u>w</u> | ater De | mand in | <u>mld</u> |

SOURCE OF WATER

It is understood that the CIDCO is presently gets water from Hetawane dam and MJP. The availability from these sources is nearly 265 mld. A project from Balganga dam is under execution, which is likely to be completed by 2016. The availability from this source shall be 350 mld. In addition a new source from proposed Kondhane dam is under consideration. CIDCO is expecting to get 250 mld of water from this source by 2026. CIDCO has worked out year wise demand of its developed/ developable area (other than NAINA) from 2015 to 2030. Based upon this data a statement showing demand, availability and excess has been prepared and shown in below Table.

Table: Statement showing Demand/Availability of Water in CIDCO area

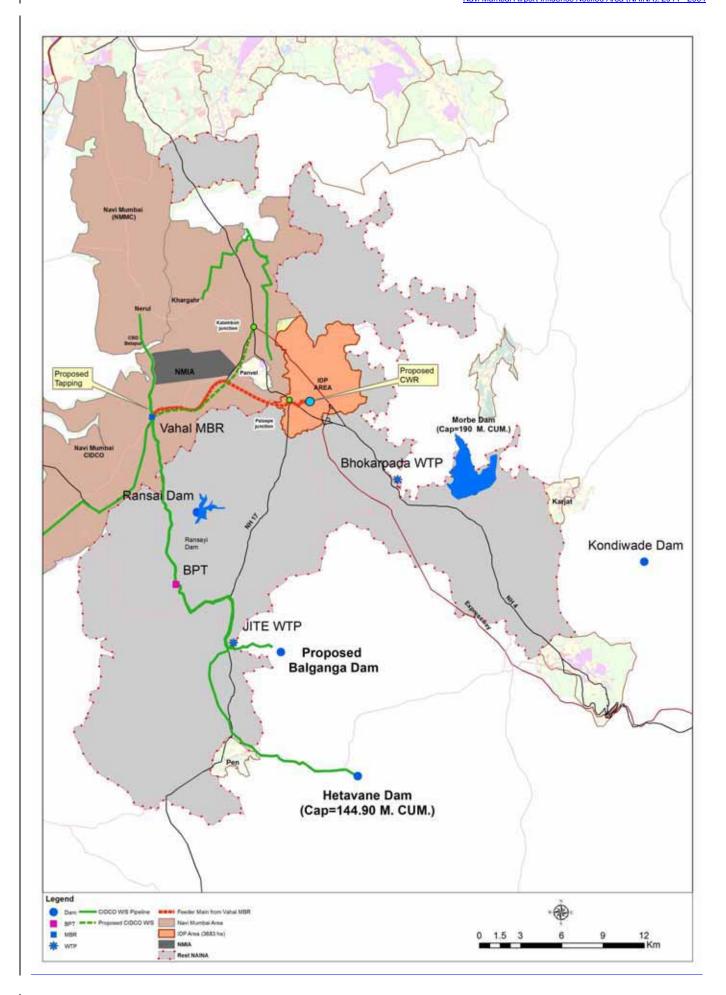

| Year | Demand in mld | Source | Present Status of source | Available Water in mld | Excess in mld |
|------|---------------|--------------|--|------------------------------|---------------|
| | | Hetawane Dam | Existing | 150 | |
| 2015 | 251 | MJP | Existing | 115 | 14 |

It is observed from above table, that CIDCO will have excess of water with respect to demand of Navi Mumbai 2016 onwards (if proposed sources are developed as expected). Ultimately in the year 2030, CIDCO shall be having 85 mld of water in excess of Navi Mumbai demand. The ultimate demand of IDP Area NAINA in the horizon year 2034 is calculated as 93 mld and the demand in 2031 is only 63 mld. Thus the demand of IDP Area can well be met from excess water available from CIDCO sources till the year 2033-34, but onwards from 2034. Some other source will be required to be tapped to meet the demand of 8 mld for IDP area. However this is subject to maximum utilization of recycled with right from the beginning.

PROPOSED sources of water

As per proposals of Balganga Water Supply Scheme (350 mld) of CIDCO, the water drawn from the dam is proposed to be treated at Nidhiwali Water Treatment Plant, from where it shall be pumped to a Break Pressure Tank, and then shall be transferred to Master Balancing Reservoir (MBR) near VAHAL through 2500 mm diameter Pipe line. Proposed water sources are depicted in below Figure.

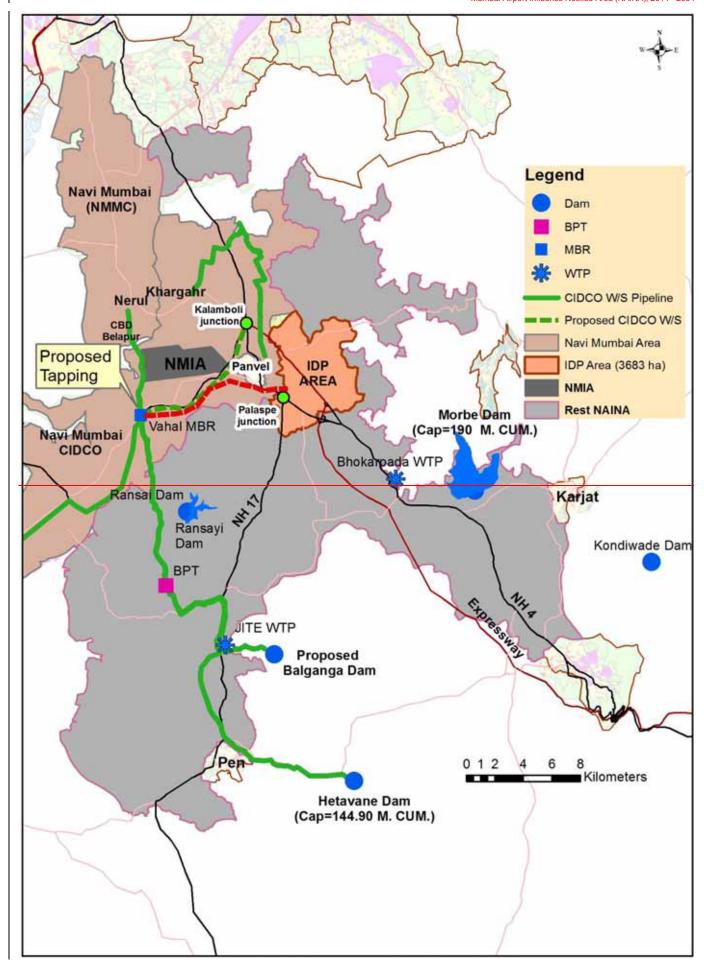

Figure: Map showing Balganga WS Project and proposed tapping at VAHAL MBR

It is proposed to draw the demand of IDP Area (92.693 mld) from this MBR. The water from this MBR is proposed to be collected in a clear water reservoir within IDP Area. The site of Clear Water Reservoir is proposed near Kolke village. Looking to the available head between proposed MBR at VAHAL and site of CWR it is proposed to draw water from this MBR under gravity to IDP CWR. The pipe line is proposed to be laid along JNPT road (NH-4B). Total length of pipe line works out as is 14500 meters.

Based upon the difference of levels between MBR and CWR, the size of gravity pipe line required has been worked out. Accordingly it is proposed to lay 1000 mm diameter Ductile Iron pipe line class-K9/ MS pipe line with inside cement mortar lining total 14500 meters long. The capacity of CWR has been kept equivalent to 8 hours storage, based on 22 hours pumping. Accordingly the capacity of CWR is proposed as 33.70 ml.

The complete IDP area has been subdivided in 6 number distribution zones, looking to the topography of the area. The capacity of Service Reservoirs has been worked out as per mass demand curve assuming 24 hours water supply and based upon the zone water demand calculated as per zonal land use. Five out of proposed six service reservoirs are Elevated Service Reservoirs (ESRs) while the Service Reservoir at zone-4 is ground reservoir proposed on hillock. The zonal demand and capacity of service reservoirs proposed is being given in below Table.

Table: Zonal Demand & Capacity of SRs

| Tuore, Zonar Bernaria & Capacity of | | |
|-------------------------------------|---------------|--------------|
| Zone Name | Demand in mld | SR Cap in ml |
| <u>Zone-1 / OHT-1</u> | <u>13.89</u> | <u>4.1</u> |
| Zone-2 / OHT-2 | 8.89 | <u>2.6</u> |
| Zone-3 / OHT-3 | <u>8.43</u> | <u>2.5</u> |
| Zone-4 / GLSR-4 | 33.15 | 9.8 |
| Zone-5 / OHT-5 | 12.50 | <u>3.7</u> |
| Zone-6 / OHT-6 | 15.74 | 4.6 |
| <u>Total</u> | 92.59 | <u>27.3</u> |

| Zone Name | Demand in mld | SR Cap in ml |
|------------------|---------------|------------------|
| Zone 1 / OHT 1 | 0.150 | 13.89 |
| Zone-2 / OHT-2 | 0.096 | 8.89 |
| Zone 3 / OHT 3 | 0.091 | 8.43 |
| Zone 4 / GLSR-4 | 0.358 | 33.15 |
| Zone 5 / OHT 5 | 0.135 | 12.50 |
| Zone-6 / OHT-6 | 0.170 | 15.74 |
| Total | 1.000 | 92.61 |

The Water from the CWR is proposed to be pumped to different Service Reservoirs through network of pumping mains. The size of all pumping main has been derived as per the criterion laid down in CPHEEO manual for Economical design of pumping mains, taking into consideration the capital investment and the capitalized investment for power charges. For working out economical size, per meter cost for seven

nearby sizes of pipe has been worked out, considering bare cost of pipe, excavation of trenches, cost of specials / valves, laying and jointing etc and most economical pipe size worked out from them.

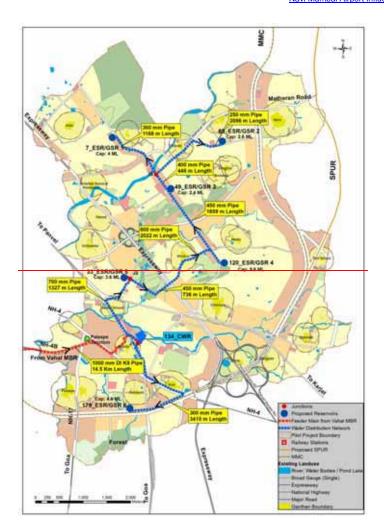

The economical size of pipe lines so worked out are been checked for the surge pressure encountered in the system. Even though the system has been checked for surge pressure, provision has been kept for zero velocity valves and air cushion valves for extra safety. Accordingly it is proposed to lay rising mains from 250 mm to 700 mm diameter. The pumping mains are proposed to be laid with Ductile Iron Pipe class K-9. The size of pipe line so worked out and proposed for laying in different reaches (nodes) is being shown in below Table.

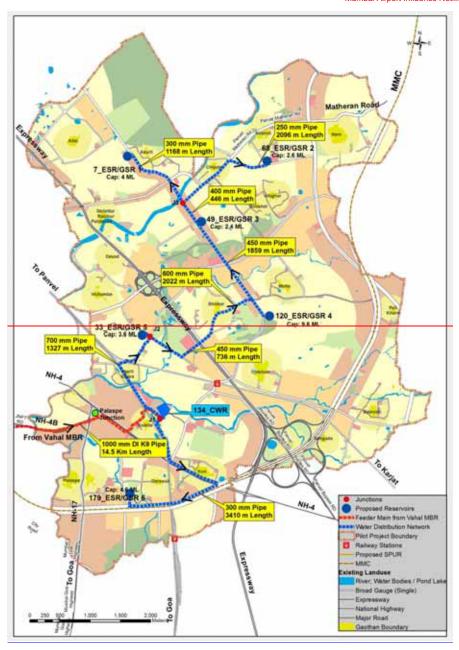

Table: Proposed sizes of clear water rising mains

The water from CWR shall be pumped to different service reservoir by Centrifugal pumping sets. Initially the Clear water pumping station shall be installed with pumping sets to meet the demand of the year 2031 only. Thus it is proposed to install 6 number pumping sets capable to discharge 198.8 litres / sec at 120 meters head coupled with 370 kw squirrel cage induction motor, out of which 4 number shall be working and 2 shall be standby. Later after 2031, the pumping sets are required to be replaced having a capacity of pumping 292.33 litres per second at 125 meters head coupled with 560 KW electric motor. Provision has also been kept for necessary electric switch gears, and power connection. The location of CWR and complete network of pump3683ing mains is shown in below Figure.

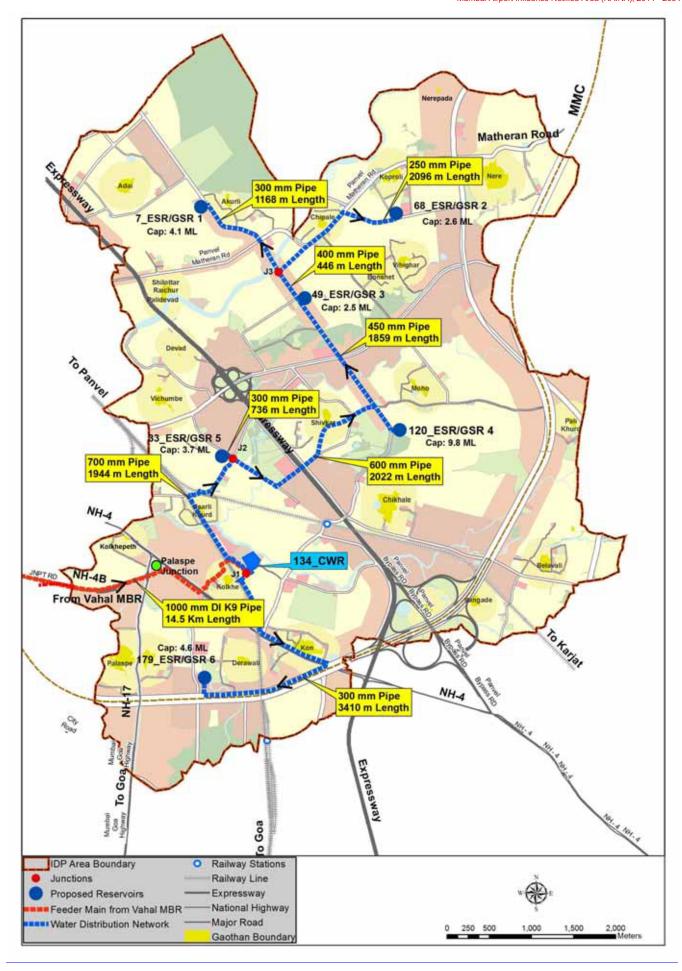

Figure: Proposed Network of Clear Water Rising Mains

Provision has been kept for HT Power line up to pumping station along with sub-station, electric cabling and metering etc. Provision has also been kept for trunk distribution system on sector level roads only as shown in drawing above.

ANNEXURE 7-3 SEWERAGE COLLECTION, TREATMENT AND RECYCLING SYSTEM

Estimation of Sewage Generation

The Sewage Collection and recycling system is planned and designed to collect, treat, and recycle all the domestic sewerage and industrial effluent generated from the IDP - NAINA Area. There are three possible options for collection and treatment of Sewage including Tertiary Treatment and recycling. These are discussed below:

Sewage and Sullage both are treated by developer of the plot at plot level: This has the disadvantage, that STPs will be located near the residential areas, secondly it will not be possible to monitor the quality of treated water as form large number of STPs. On the other hand Sewage from Gaothans and small plots has to be treated at community level STPs, which will again involve infrastructure cost. This also have the problem that how the waste effluent from so many STPs shall be carried to suitable disposal points.

Sullage is treated at developer level and Sewage is carried to Community level STPs: This will again have the problem of monitoring the quality of treated water being supplied, and sullage from Gaothans / small plots as stated above.

Sewage and Sullage both are taken to community STPs and treated water recycled: A comprehensive sewage collection system, along with community STPs / TTPs and recycling system is developed. Though this will involve some extra infrastructure cost on account of collection system and distribution of recycled water this is the safest way of treating the total sewage. In this system the tertiary treated water can precisely be distributed to urban greens / parks, different industries for washing and for flushing use in residential areas.

As prescribed in CPHEEO manual, it is assumed that 80% of water actually supplied at consumer end for domestic use and 60% of water supplied to industries be generated as Sewage/ waste water. While working out sizes of collection system and capacity of Sewage Treatment Plant, provision has been kept for 20% infiltration through sewer lines. But while calculating the water available for recycling the infiltration has not been considered, assuming that during summers and winters the infiltration shall almost be negligible. Accordingly the sewage generated capacity of STPs and Tertiary Treatment Plants required has been worked out and shown in below Table.

Table: Sewage Generated, Capacity of STPs & TTPs required

| Sewage Generation & Treatment Plants Capacity | <u>2016</u> | <u>2031</u> | <u>2034</u> |
|---|--------------|-------------|---------------|
| Sewage Generation in mld | <u>17.79</u> | 86.08 | <u>118.31</u> |
| Capacity of STPs required | 18.00 | 86.00 | 119.00 |
| Capacity of TTPs Required | 12.00 | 58.00 | 80.00 |

| Sewage Generation & Treatment Plants Capacity | 2016 | 2031 | 2034 |
|---|------------------|------------------|--------|
| Sewage Generation in mld | 17.23 | 85.01 | 118.86 |
| Capacity of STPs required | 17.00 | 85.00 | 119.00 |
| Capacity of TTPs Required | 12.00 | 57.00 | 80.00 |

Navi Mumbai Airport Influence Notified Area (NAINA), 2014 - 2034 Draft Interim Development Plan for 23 villages in Navi Mumbai Airport Influence Notified Area (NAINA), 2014 - 2034

The recycled water shall primarily be used for proposed urban greens as horticulture requirement and the remaining shall be used in industries mainly for cleaning/washing and in residential areas for flushing etc.

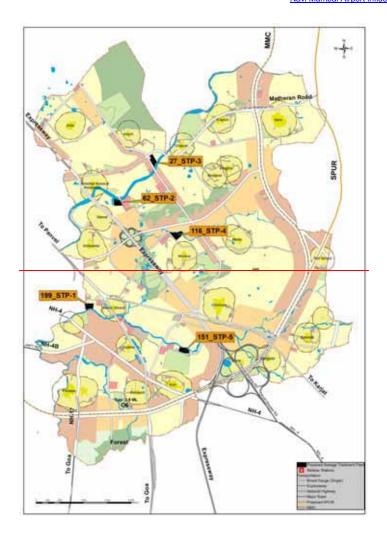

Looking to the topography of the area, pace of development and land use of IDP, the entire IDP area is divided into 5 Sewerage Zones. The related Tertiary Treatment Plant is also proposed to be installed on the side of STP. The Capacity of Sewage Treatment Plants and Tertiary Treatment Plants proposed zone wise is being given in below Table.

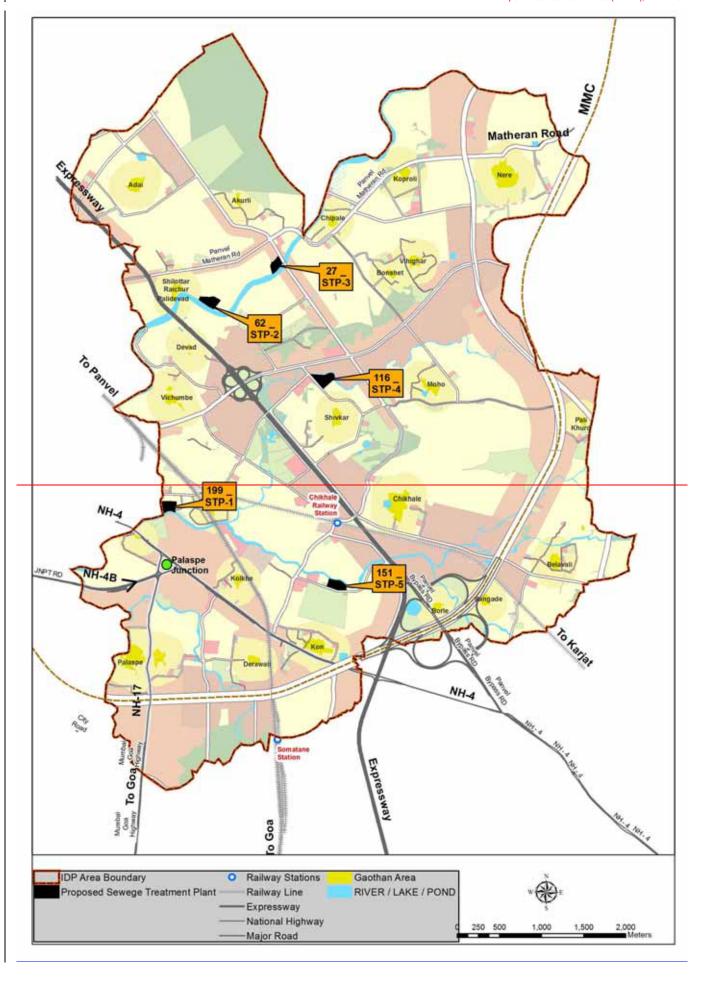

Table: Zone wise Capacity of proposed STPs and TTPs

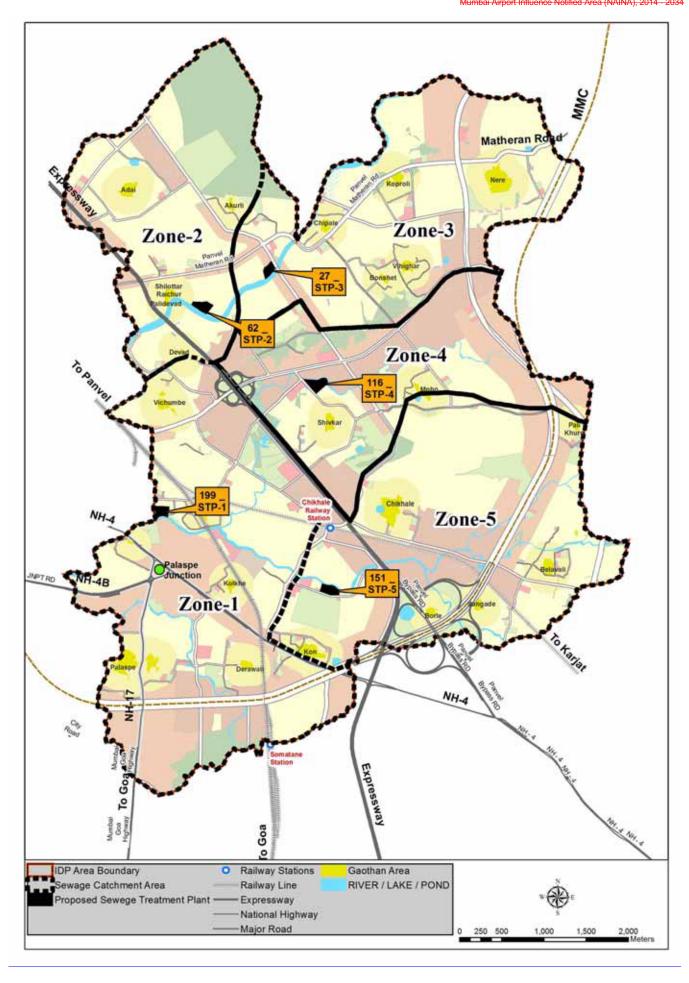

| Sewerage Zone | Capacity of STP | Capacity of TTP |
|-----------------|-----------------|-----------------|
| Sewerage Zone-1 | 36.89 | 24.8 |
| Sewerage Zone-2 | 19.04 | 12.8 |
| Sewerage Zone-3 | 20.23 | 13.6 |
| Sewerage Zone-4 | 16.66 | 11.2 |
| Sewerage Zone-5 | 26.18 | 17.6 |
| Total Capacity | 119.00 | 80.00 |

Sewage Collection System

The Sewage / Effluent collection system is provided to collect the domestic sewage / industrial waste water from the residential / industrial areas and to convey it to the proposed Sewage Treatment Plant of that zone. Since industrial waste water is very meagre in quantity, thus common collection system is provided for sewage and waste water collection. The zoning and collection network is proposed in such a way that the flow of sewage follows natural slope and conveys the sewage to treatment plant (located at the lowest elevation) under gravity flow. The location of Sewage Treatment plants along with Tertiary Treatment Plants is shown in below Figure.

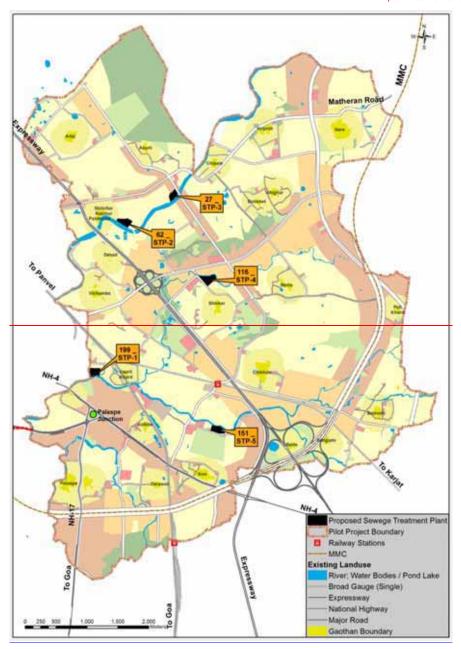

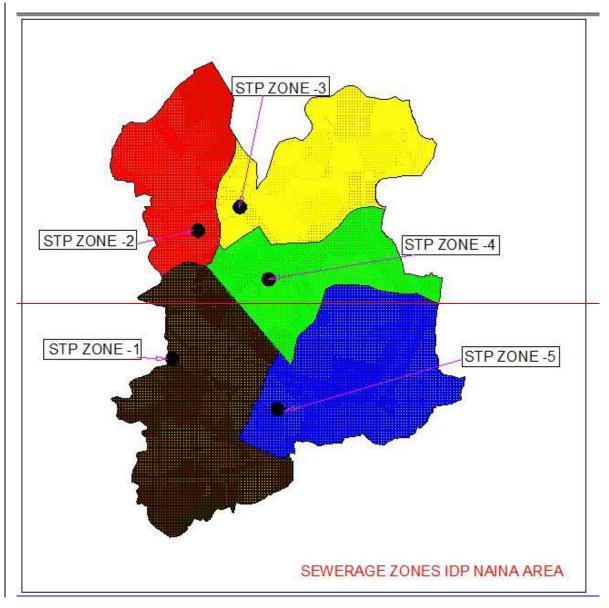

Figure: Map showing Location of Sewage and Tertiary Treatment Plants

The Sewage Collection system is being proposed at sector level roads only. The internal sewers including laterals shall be provided by the land developers themselves, which shall further be connected to trunk sewerage system. The sewage collection network is based on following parameters, as per the recommendations in the manual of Sewerage and Sewage Treatment issued by CPHEEO, Ministry of Housing Government of India:

Minimum velocity at designed peak flow : 0.8 meters / sec

Maximum velocity in SW Pipes : 1.4 meters / sec

Maximum velocity in RCC / HDPE Pipes : 2.5 meters / sec

Max. depth of flow in sewers at ultimate peak flow :

Up to 400 mm sewer : half full
400 to 900 mm sewer : 2 /3rd full
Above 900 mm sewer : 3/4th full
Minimum size of sewer : 160 mm

Maximum spacing of Man holes

Up to 300 mm sewer : 30 meters

Above 300 mm sewer : 90 meters

Additional manholes : At every junction, change of

Alignment/ gradient/ size.

Size of man holes

Up to 1.5 metres depth : 900 mm dia.

1.5 to 2.5 mtrs depth : 1000 mm dia

Above 2.5 mtrs depth : 1200 at bottom & 900

at top

Formula adopted for design : Manning's Formula

V = 1 / n X R 2/3 X S 1/2

Here

V = Velocity in meters

R = Hydraulic mean depth = WA / WP

S = Hydraulic slope in M / meter

N = Manning's coefficient

= 0.012 for SW Pipes

= 0.011 for RCC / PSC pipe

SEWAGE / WASTE WATER TREATMENT AND TERTIARY TREATMENT PLANT

It is proposed to provide conventional Activated Sludge Process type of Sewage / Treatment Plant. The plant shall comprise of Coarse screen chamber, Sewage pumping station, Fine screen chamber, Grit chamber, Oil and Grease traps, Activated sludge type Aeration Chamber with Fluidized Bed Reactor or Moving Bed Biofilm Reactor, Secondary Sedimentation tank, Air Blowers, Sludge pumps, and Sludge drying mechanism.

The Tertiary Treatment Plant (TTP) shall comprise pre-chlorination chamber, rapid gravity sand filters and post chlorination mechanism. The TTPs are designed to receive an inflow of 85% of Sewage generated assuming 15% losses in STP. The losses in TTP are taken as 5%.

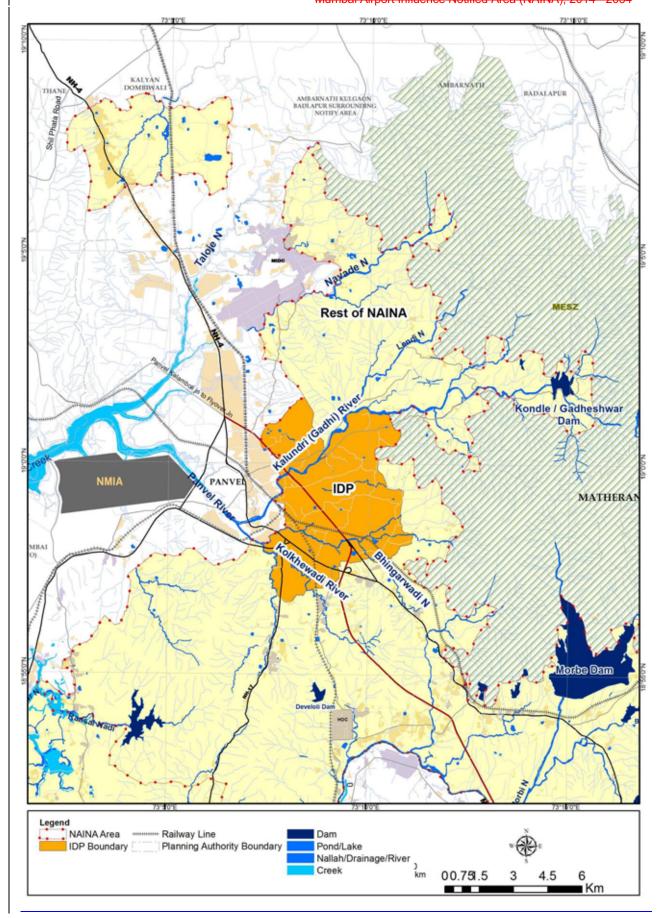

Reuse of Tertiary Treated Water

The Sewage treated in STP and then the secondary water treated in Tertiary Treatment Plant in each zone shall be collected in individual Clear water reservoir, wherefrom it shall be pumped for horticulture / industrial use and for flushing in the same zone. The water shall be collected by individual users in their ground tanks for their use. Provision has been taken for Clear water reservoirs, pumping machinery and distributaries rising mains DI Pipe class K-9.

RIVERS AND ROAD SIDE DRAINAGE

GENERAL topography and Rivers

Two major rivers and a small nalla of about 8 to 15 meters width are passing through IDP-NAINA area, a detailed map showing these rivers is shown in below Figure.

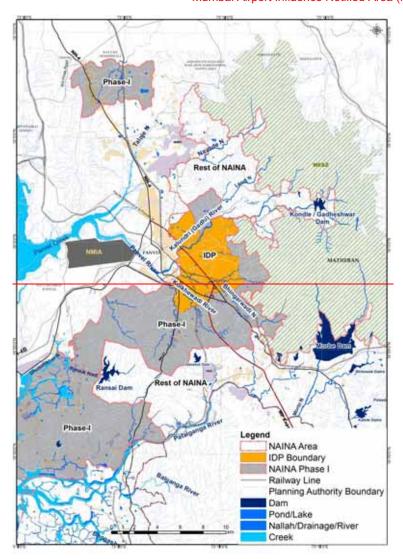

Figure: Map showing the rivers flowing through IDP Area

In general the drainage of the area is from North East (where high hills are seen) towards South West. Terrain of the area is plain except to follow the drainage pattern towards rivers. The levels range between 32 to 24 meters on Eastern boundary of IDP and 5 m to 12-13 meters on Western boundary. Though in the hilly terrain in North East of IDP but outside IDP boundary the levels ranges between 400 to 500 meters on hill peaks. The details about these rivers are being given below:

Gadhi or Kalundri River: It has two tributaries. On one of the tributaries is Gadheshwar dam at the foot hills. One of the tributary as well as the main river passes through IDP area. The river flows from North East to South West direction. The river originates from the hills on the North East side of IDP area. All drainage from the north east side of IDP area goes to this river/ its tributaries.

Kolkhewadi River: This River flows from East to west through southern part of IDP area. The levels range from 30 m to 8 meters except for the hilly terrain. It meets with the Gadhi River outside IDP area and finally discharges in to the sea.

One small nala of about 8 to 15 meters in width also passes through IDP area. It flows from East of IDP area to south and finally meets the Kokhewadi River. It is very much meandering in nature and divides the total IDP area almost in two equal halves.

The rivers flowing in IDP area were checked for flooding at critical intensity of rain fall. It was done as per empirical formulae suggested by Indian Meteorological Department. It was found that in general no flood situation is seen in IDP area.

Methodology adopted for checking the rivers for flooding

CIDCO had provided topographic data along these rivers. The survey was reported to be carried out for study of rivers by CWPRS for the proposed project of new International Airport near Panvel. Based on these survey levels, "L" Sections and Cross-sections along the rivers were generated and used for analysing maximum water level at major / critical points during maximum intensity of rain fall.

Analysis for Maximum Intensity of rain fall:

The data for maximum one day rain fall at Santacruz rain gauge station from the year 1950 to 2005 and at Colaba rain gauge station from the year 1901 to 2005 were made available by CIDCO. The hourly rain fall data for 26th July 2005 for these stations was also provided. Based on these data the maximum intensity of rainfall at 100 years return period was worked out as per norms and procedure recommended by Indian Meteorological Department.

Table: Maximum one day rainfall at Santacruz and Colaba rain gauge stations

| Santacru | Z | , | | Colaba | | | | | |

It shows that the maximum hourly intensity of rain on 26th July 2005 was recorded at 16 hrs, which was 136 mm at Powai Colaba rain gauge and 190.3 mm at Santacruz rain gauge station.

But the maximum hourly rain fall at other stations within Mumbai did not record such a high rain during any hour on the day. The highest rain fall recorded at other stations on 26th July 2005 is as follows:

| Toble: Me | vimum hourly | Dainfall at | Other stations | in Mumbai | (26th July 2005) |
|-------------|------------------|-------------|----------------|------------------|---------------------|
| Table: Ivia | XIIIIUIII HOUITN | Raiman at | Other stations | III Iviuiiibai (| 1 Z0111 JUIN Z003 I |

| Rain gauge station | Time | Hourly rain fall (mm) |
|--------------------|--------------|-----------------------|
| Panvel | 12 to 13 hrs | 76.0 |
| Kharghar | 10 to 11 hrs | 105.0 |
| Nerul | 14 to 15 hrs | 72.5 |
| Vashi | 07 to 08 hrs | 100.0 |
| CBD Belapur | 09 to 10 hrs | 105.0 |

The Indian Metrological Department, in its Flood Estimation guide lines issued vide No. K8M/19/1992 (CWC and IMD) for West Coast Region, Konkan and Malabar, has suggested the procedure for conversion of one day rainfall at a rain gauge station to Areal rain fall for a given return period. The maximum rain fall recorded in a day on both Colaba and Santacruz stations can easily be taken as the maximum rain fall at 100 years or more return period, since no such heavy rainfall is observed in a day during past 115 years. The storm duration on 26th July 2005 lasted for about 16 hours.

Thus by using the suggested table for conversion of 944.2 mm point rainfall in to areal rainfall for a recorded 16 hours duration and for 125 sq-km² catchment, the coefficient for maximum one day areal rainfall for the catchment reads as 93% (By interpolation of 100 and 150 sq-km² area). Therefore the suggested maximum areal rainfall in 24 hours for 100 years return period comes as 878.1 mm.

Now the Hourly distribution Co-efficient of areal rainfall as per table suggested by IMD reads 0.16.

So the Critical intensity of rainfall as per IMD recommendations comes as = $0.16 \times 878.1 = 140.49 \text{ mm}$ per hour. Intensity as per analysis of IIT Mumbai:

The Indian Institute of Technology, Powai Mumbai, has conducted an study in the year 2012. The report was prepared after considering the critical flood scenario of 26th July 2005. In this report it is suggested that following critical intensity of rain fall be adopted for design of major natural drains / diversion channels in Mumbai.

Table: Return Period and Intensity of Rain (mm/hr)

| Return Period | Intensity of rain (mm/ hr) |
|---------------|----------------------------|
| 2 Years | 55.2 |

| 5 Years | 74.9 |

Here it can be seen that the computed value of critical intensity of rain fall as per para-9 is in fairly good agreement with the computed values of IIT Mumbai as shown in para above.

Intensity as per NATU Committee:

CIDCO had set up a Technical Expert Committee, called Natu Committee for review of Storm Water Drainage System in Mumbai and to suggest remedial measures to avoid flooding. The committee has suggested Hydraulic and Hydrological Norms for the design of Storm Water Drains in New Mumbai. These norms have been circulated by Engineering Design Circle-II of CIDCO. These norms suggest that a Storm Intensity of 164.8 mm/hour be adopted for design of Diversion channels having a catchment area of 10 to 15 sq km².

The below Table, the comparison of critical intensity computed as per IMD norms, computed by IIT Mumbai, and recommended by NATU committee:

Table: Intensity of Rain fall computed by different methods / Agencies

| Computed as per IMD Norms | 140.49 mm / hour |
|--------------------------------|------------------|
| Computed by IIT Mumbai in 2012 | 141.00 mm / hour |
| Recommended by NATU Committee | 164.80 mm / hour |

From above it can be revealed that the value for critical intensity of rain fall suggested by NATU Committee and being adopted by CIDCO for design of drains is slightly (about 15%) on higher side then the computed values as per IMD norms and as computed by IIT Mumbai. But to be on safer side the norms as circulated by CIDCO are being adopted for the design of Storm Water Drains in NAINA area.

Thus the design of Storm Water Diversion Channels in NAINA area has been designed taking the Intensity of Rain fall as 164.8mm / hour.

Journal of Environmental Research And Development

Vol. 6 No. 3, Jan-March 2012

Thus from the above it can be observed that there is increasing trend at both the rain gauge stations for annual maximum daily rainfall series.

Hourly rainfall data analysis

Hourly rainfall data from year 1969 to 2008 for

both the rain gauge station was collected from India Metrological Department (IMD) and the basic statistical analysis using gumbell distribution with maximum likelihood method of estimation for both rain gauge stations has been carried out and the results are presented at Table 3.

Table 3: Basic statistics for hourly rainfall

| Basic statistics | Colaba (1969-2008) | Santacruz (1969-2008) |
|---------------------------------|--------------------|-----------------------|
| Number of years of observations | 40 | 40 |
| Minimum | 28.3 | 27 |
| Maximum | 113 | 190 |
| Mean | 56.9 | 60.4 |
| Standard deviation | 20.9 | 31.3 |
| Median | 51.4 | 49.9 |
| Coefficient of variation (Cv) | 0.366 | 0.518 |
| Skewness coefficient (Cs) | 1.26 | 2.61 |
| Kurtosis coefficient (Ck) | 3.49 | 9.58 |

The maximum rainfall intensity at Santacruz rain gauge station is 190 mm/hr whereas at Colaba rain gauge station it is 113 mm/hr. Thus, the rainfall at both the rain gauge stations which are only 27 km apart varies in spatial as well as temporal manner substantially.

For the effective decision support system to

the hydrologist and engineers, the analysis of annual maximum hourly rainfall series for prediction of rainfall estimates for various return periods was carried out using gumbell distribution with maximum likelihood method of estimation. The results are presented in Table 4.

Table 4: Rainfall estimates for different return periods

| Return period (years) | Colaba (mm/hr) | Santacruz (mm/hr) |
|--------------------------|-------------------|----------------------|
| 2 | 53.1 | 55.2 |
| 3 | 60.8 | 64.5 |
| 5 | 69.4 | 74.9 |
| 10 | 80.1 | 87.9 |
| 20 | 90.5 | 100 |
| 50 | 104 | 117 |
| 100 | 114 | 129 |
| 200 | 124 | 141 |

550

Time of Concentration

The time of concentration is the time required for a drop of water to run from the most remote point in the catchment to the point for which the runoff is being estimated. The time of concentration is based upon two catchment characteristics, first the length of catchment (L) and the difference in level from upstream to outlet of catchment (H). This can be derived by three formulas known as Bhatnagar formula, Kirpich formula and the California formula. The basic formula in all the three is the same, except the value of constant is different in different formula.

The basic formula for Time of Concentration is $Tc = \{xL^3/H\}^y$

Here Tc = Time of Concentration in hrs

L = Length of catchment in km

H = Difference of level in meters

x and y are the constants, having different value in different formula

The value of x and y in different formula is as follows:

| Formula | Value of "x" | Value of "y" |
|--------------------|--------------|--------------|
| Bhatnagar Formula | 2.45 | 0.343 |
| Kirpich Formula | 0.80 | 0.385 |
| California Formula | 1.19 | 0.385 |

A comparison of all the three formula has been done taking in to consideration different catchment characteristics for rivers. It has been revealed that the values with Bhatnagar formula are the highest, and Kirpich formula is the lowest. The California formula gives the values in between two. CWPRS and CWC have suggested to use California formula. Thus the Time of Concentration in our calculations have been worked out as per California formula.

Critical Intensity of Rainfall

The critical intensity for a catchment is that maximum intensity which can occur in a time interval equal to the time of concentration. This critical intensity multiplied by the catchment area above shall give us the total runoff at the point of consideration. The critical intensity can be worked out by the formula

```
\begin{split} & \text{Ic} = I \,. \{2 \,/\, (\text{tc+1})\} \\ & \text{Here} \quad \text{Ic} \qquad = \text{Critical Intensity of rainfall in cm / hr} \\ & \text{I} \qquad = \text{Intensity of rainfall in cm / hr} \\ & \text{tc} \qquad = \text{Time of concentration} \end{split}
```

Based upon the Intensity of rainfall 16.48 cm / hour analysed above, the Critical Intensity has been worked out for different time of concentration, which has been used in the design of runoff.

Runoff Coefficient

The runoff coefficient is the function based on the surface of the catchment. The major criteria need to be considered are porosity of the soil, area shape and size of catchment, vegetation cover, surface storage and the initial state of wetness of soil. For different type of catchment surface different values of runoff coefficient are recommended in relevant BIS. The runoff coefficient for different type of surface in catchment is given below Table.

Table: Run off coefficient for different type of surface

| Type of surface | Runoff Coefficient |
|---------------------------|--------------------|
| Steep / Bare rock surface | 0.90 |

| Paved surfaces in city | 0.90 |
|---|------|
| Rock and Steep slopes but wooded | 0.80 |
| Plateaus (Lightly wooded) | 0.70 |
| Clayey soils, stiff and bare | 0.60 |
| Clayey soils, stiff and lightly covered | 0.50 |
| Loamy, lightly cultivated or covered with woods | 0.40 |
| Loamy largely cultivated | 0.30 |
| Sandy soil, light growth | 0.20 |
| Sandy soil, covered with heavy bush | 0.10 |

When we look for the area within the catchment of rivers in project boundaries, it is found that the rivers do originate from nearby hills which are partially wooded and then flow through project area. The slopes are also very steep. Thus up to the foot hills a run off coefficient of 0.0.85 shall be considered. Onwards from the foot hills the soil is partially clayey and loamy. But as per plan the complete area has to be urbanised. After urbanisation almost 90% of the area shall either be constructed or paved for paths, roads etc. Only 9 to 10% of the area is likely to be left as urban greens/ woods. Thus for remaining project area a run off coefficient of 0.90 has to be considered.

But CIDCO in the design parameters circulated by them has suggested to adopt a Run off coefficient of 0.93 for 10-15 sq-km² catchment. Though it seems to be on higher side, but is being adopted to be on safer side.

Coefficient of Rugosity

The coefficient of rugosity is the factor which depends upon the surface of stream/ river/ channel. The BIS recommends following factors to be considered for different surfaces.

Table: Coefficient of Rugosity for different type of channel surface

| S No | Channel surface | Coefficient of Rugosity |
|------|--|-------------------------|
| | Natural Streams | |
| 1 | Clean, Straight banks, full stage, no rifts or deep pools | 0.025 |
| 2 | Same as (1), but some weeds and stones | 0.030 |
| 3 | Meandering, some pools and shoals, clean | 0.035 |
| 4 | Same as (3), lower stages, more ineffective slope and sections | 0.040 |
| 5 | Lined channels | 0.020 |
| 6 | Channels with rubble pitching | 0.030 |

Looking to the situation of river as seen at site, the rivers are meandering and at several places having ineffective slopes. Thus the rugocity coefficient of 0.040 is to be adopted. CIDCO has also recommended to adopt a rugosity coefficient of 0.040 in the design criteria circulated by them. But for the part where development within IDP-NAINA area is to be undertaken, it is proposed to train the river including creating a regular slope by dredging and filling, This shall be provided with concrete floor and masonary lining on side slopes. The sides shall be provided with weep holes so that it does not affect the ground water environment of the area. This will result in smooth flow and quick transfer of water from the project area. On the other hand some of the land on sides of river can be reclaimed,

which can be used for construction of roads along river. On the side of these roads urban greens or woods can be generated to give a pleasant environment in project area.

Thus for the part of river within project area, where the river is proposed to be trained a rugocity coefficient of 0.020 shall be adopted.

Flood Discharge

The flood discharge in a particular section of river shall depend on the Critical intensity of rain fall, Catchment area intercepted by that section and run off coefficient of the catchment. The formula used shall be:

 $Q = 0.028 \times P \times A \times Ic$

Here Q = Flood discharge in Cum / sec

P = Run off coefficient of catchment

A = Area of catchment intercepted in hectares

Ic = Critical Intensity of rainfall in cm per hour for related time of concentration

Flood level in a section

After calculating the flood discharge, the flood levels in a particular section shall be worked out based on the formula of conveyance factor and slope of the stream. For this the velocity of flow in the section under consideration shall be worked out. The velocity shall be dependent on the slope of stream, rugocity coefficient, Area of stream and the perimeter.

The Velocity of flow= $V = (R^0.667 \times S^0.5) / n$ Here R = Hydraulic mean depth = Area / Wetted Perimeter of the stream at the section S = Slope of catchment = Length of catchment/ Fall in m

Based upon the velocity, the area required to accommodate the flood encountered is worked out, which in turn gives the level in the river at the time of flood in particular section. For this we have applied the formula:

Coefficient of rugocity

The Flood discharge = $Q = A \times V$ Here A = Area of stream V = Velocity of water in the stream

n=

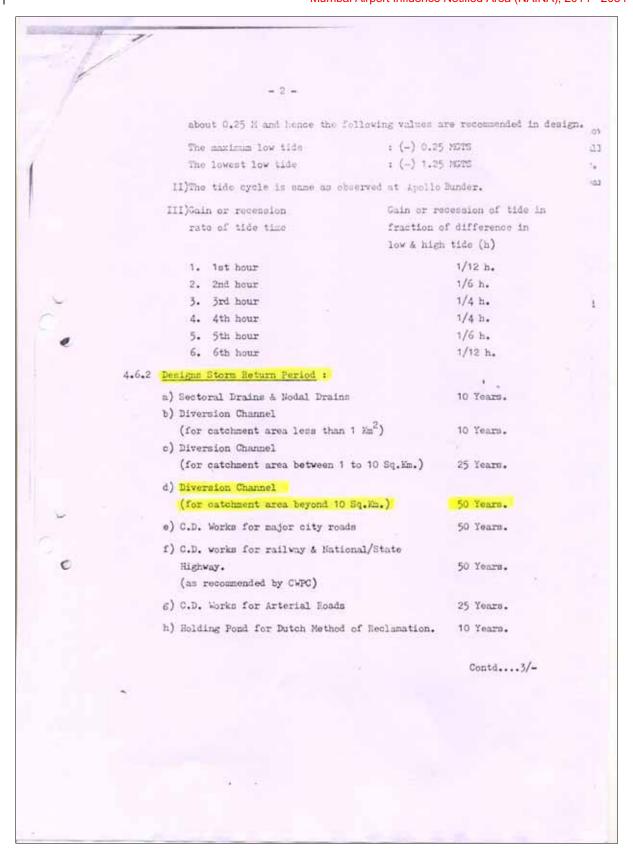

Based upon above calculations the flood level in the river is worked out and has been checked with the ground level in surrounding area.

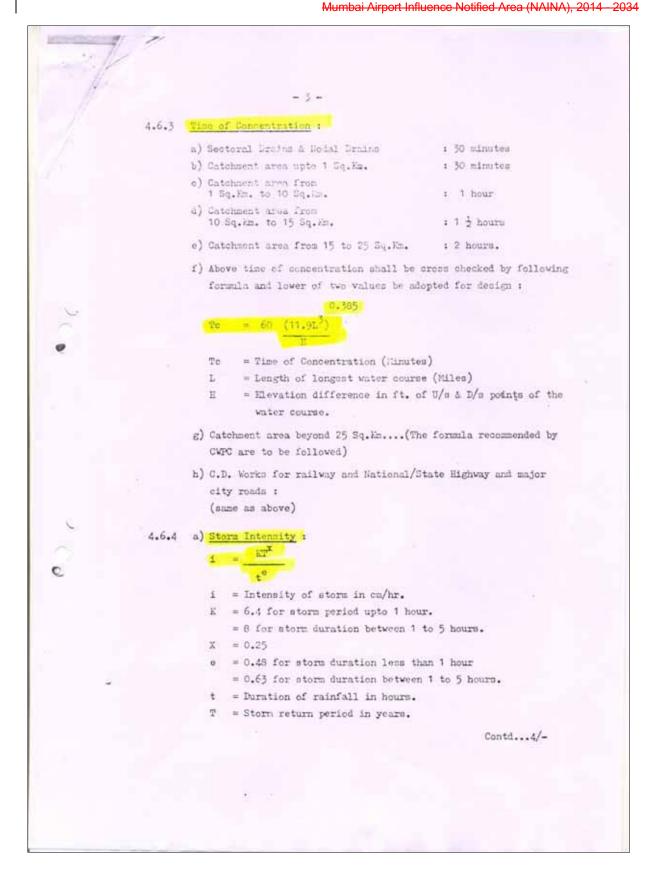

It is found that at critical/ junction points a minimum free board of 300 to 1500 mm is available. Thus based on the calculations made with above empirical formulae, no flood situation is seen within IDP Area. However as already suggested CIDCO must go for 1-D and 2-D mathematical model study of these rivers to rule out the likely possibility of flood situation in the area before going for urban development.

Thus as suggested in previous paragraphs, the stretch of rivers within the IDP- Area has to be trained and lined, after river model study.

The detailed calculations for some of the nodes considered critical and analysed for flood have been shown in the below images.

CIDCO/EE(PP-I)/SE(D)TI No.307 4th December, 1992. Sub: Hydraulic & Hydrological norms for the design of S.V. Drains in Mew Bomboy. The Technical Experts Committee headed by Shri S.V. Matu has modisome of the hydraulic & hydrological parameters for the design of S.M. D Syntems in New Bombay. The revised norms which are given below shall form part of the development control regulation in order to uniformity in the designs from various agencies. These norms shall supercode the earlier hydraulic and hydrological norms circulated. 4.6.1 a) TIDE LEVELS : Apollo Bunder highest tide : 2.89 MOTS : 3.25 MOTS Panvel Creek upto Waghavli Thane Creek : 3.25 MGTS : 2.89 MCTS Dronagiri facing Bombay/Harbour Karanja Creek upto Khopta : 3.25 MGTS (The values assumed for Thane Creek Bridge, Railways and National Highwa bridges and Airoli bridges : 3.19 MCTS. The observations carried out in 1973 by CIDCO at NOCIL Jetty show that, there is difference of + 0.3 M. between tide at NOCIL Jetty and that at Apollo Bunder). b) TIDE TIMING : 20 minutes lag for Thane, Kalwa and Karanja Creeks over Apollo Bunder tide timing. c) TIDE VELOCITY : 2 M/sec. for Panvel. Thane and Karanja Creeks. d) TIDE CYCLE : Tide cycle is same as observed at Apollo Bunder. e) TIDE PROFILE : I) The tide profile observed in Thane, Panvel and Karanja Cree is similar to Apollo Bunder. The highest of spring and nes levels are same as Apollo Bunder values. In monsoon, the 1 tide water observed in the Creek (Panvel, Thane) are higher Contd.

Road side drainage

The Storm water drainage system is provided to collect the rain water with in the project area and to cater it to the natural drains / rivers within the project area which in turn are discharging in to the Arabian Sea on west of NAINA. The area in general is having a slope from North East to South West direction. Due care has to be taken during design of drainage system, that the drains flow along the

natural slope of ground, to avoid unwanted earth work during construction. The drainage system shall be proposed on both sides of proposed roads.

As the drains are discharging in to the natural drains with in project area, it is proposed to create few water harvesting structures at suitable locations. For this it is proposed to construct low height weirs of 1.5 metrs, based on the adjoining contours. The rain water collected from the proposed drains shall be stored in these weirs. This will help in improving general water table in the area, and will also give a good aesthetic and environmental view in the green buffer surrounded with woods.

Design Criteria and Parameters

The design of storm water drainage system is to be based on IRC - SP: 50 (Guide Lines for Urban Drainage). This involves:

Calculating the total discharge that the system will be required to drain off.

Fixing the slope and dimensions of the drain to have adequate capacity to carry the discharge and afford proper maintenance.

The discharge is dependent upon intensity and duration of precipitation characteristics of the area, and the time required for such flow to reach the drain. The storm water flow for this purpose has been determined using the rational method, as suggested in IRC - SP: 50 for road side drains.

The road side drains are not to be designed for the peak flow of rare occurrence; however it is necessary to provide sufficient capacity to prevent too frequent a flooding of the drainage area. However it is recommended that road side drains be designed for 2 years return period, and the natural drains passing nearby for a 5 year return period. But CIDCO in its guide lines circulated has recommended that Sectoral and Nodal drains be designed for 10 years return period, thus drains shall be designed for 10 years return period.

Rain fall intensity

It has been observed that shorter the duration of critical rainfall, the greater would be the expected average intensity during that period. Say during a 30 minute rainfall, some 5 minute period will have average rain fall intensity greater than that of the whole storm. The critical duration of rainfall will be which produces maximum runoff. This duration has been taken equal to the time of concentration.

Thus based upon the rainfall data from Indian Meteorological department, and rational analysis of the data, Critical Design Intensity of Rain fall for 10 years return period has been worked out, which comes as 87 mm / hour.

Based on above values, and Empirical formula as per IRC- SP-13, a table of design rainfall intensity for different values of time of concentrations prepared for adopting in the design of drain.

Time of concentration

The time of concentration shall be taken as the time required for a drop of water to run from the most remote point of the road surface to the point for which the runoff is being estimated. The time of concentration shall be worked out based upon the empirical formula in IRC - SP - 13.

Run off coefficient

The coefficient of runoff is the portion of precipitation that makes its way to the drain. Its value depends upon, permeability of the surface, type of ground cover, shape and size of catchment area, the topography and geology. As per recommendation of IRC-SP-50, the following values have to be adopted for the design of storm water drains in PEMH area:

Residential Area : 0.60

Industrial Area : 0.55

Open / Parks : 0.15 Roads : 0.90

Rational Formula adopted for estimating Peak Run-off rates

The IRC – SP: 50: 1999, recommends, that for the smaller water sheds following rational formula is to be used for estimating peak run-off rates:

Q = 0.028 PAIc

Here: Q = Design peak run off rate in cum / sec.

P = Coefficient of run-off for catchment characteristics.

A = Area of catchment in hectares.

Ic = Critical intensity of rainfall in cm per hour for the selected return period and the duration
